Response to Gold's Gym Member Management System RFI

RFI designation GG-2026-MMS-RFI-001

Submitted by FLiiP - July 10, 2026

Primary contact: Mike Tisdale, Senior Account Executive
Executive contacts: David Bourbonnière, Founder & CEO · Thomas Albisser, COO & CTO

Confidential. Prepared solely for Gold's Gym evaluation.

A Word from Our Founder

Rick, Ryan, and the Gold's Gym team,

I come from the gym floor. I opened my own gym in 2012, operated it for eight years, and built FLiiP to fix the problems I lived every day: too many systems that don't talk to each other, too much time lost on low-value tasks, too little visibility to actually run the business. Everything we build starts from that reality, built by a North American team for operators in this market.

Gold's Gym is not another logo for us. It’s the global reference of this industry, the name that defined what a gym could be for generations of members. I was one of them; I trained at Gold's Gym when I was younger. That connection runs deeper than me: Mike owned and operated his own Gold's Gym franchise for six years, and Anthony, who leads customer onboarding and training at FLiiP, managed a Gold's Gym location for years before joining us. Today, Gold's Gym Quebec runs their 2 locations on FLiiP. When this opportunity came, nobody here treated it as another line in the pipeline.

I also want to thank you for your openness. We arrived at the eleventh hour of your process, and you gave us a real seat at the table anyway. This RFI is thorough and the window was extremely tight, and we chose to give it our maximum effort regardless, because we believe the opportunity deserves nothing less. Where we are strong, we said so with evidence. Where something is not there yet, we said that too, with a date.

We are not asking for a decision today. FLiiP is a North American company, in your time zones and on the ground where you operate, and our ambition is simply to earn our place in your RFP round, then to prove, in the deep dives and through the operators who know us best, that FLiiP can be the best partner Gold's Gym will find.

David Bourbonnière
Founder & CEO

Why Now

For a decade, fitness software has consolidated instead of innovated. Nearly every leading platform has been acquired and rolled into a larger portfolio, and the pattern repeats each time: the roadmap slows, innovation gets delegated to bolt-on partners, and operators inherit the same aging stack under a new logo. The vendors stopped pursuing a mission and started pursuing a multiple.

You know this history; it is written into your own RFI. Sections 12.6 and 15.7 are not the work of a team that has been treated well by its vendors. We will stand behind both, in writing, without hesitation.

When a platform actually stays true to its purpose, everything changes downstream: franchisees get a simple product and a team they can rely on, and they spend their energy where it belongs, coaching members, developing teams, and growing their markets.

And the timing is yours as much as ours. Gold's is retooling its stack once, moving off the incumbent platform regardless of the vendor chosen. If there is ever a moment to select a partner on merit rather than inertia, it is exactly now.

Why FLiiP

FLiiP is the challenger in this evaluation, and we run the company that way on purpose: it forces us to do what larger vendors no longer do. Go above and beyond, every day, execute better and faster, and put innovation into everything we ship. But challenger does not mean unproven. Eleven years in, FLiiP serves 1,500+ customers across 10+ countries, operates a 250-location international franchise in production, and is backed by U.S. institutional investors. Founder-led and 100% dedicated to fitness, we have no ambition to drift into other verticals; this industry is the whole company.

With FLiiP, Gold's will not be one logo among hundreds. You will have a seat at our roadmap table, dedicated development bandwidth, and early access to what we are building: the gym of the future.

Two years ago, a 250-location international franchise made this same bet on us, and plenty of people doubted it. We promised we would onboard them in months and stand behind them as a true partner. We onboarded 170 locations in the first 6 months, and they have grown every quarter since.

We are ready to make that bet again, with the brand that defined this industry.

Table of Contents

Thank you for the opportunity to respond, and for extending the submission window following our July 8 session. This response follows the RFI structure section by section (Sections 4 to 12), per Section 14.2. Functional requirements 5.1 to 5.14 are answered row by row in the accompanying RFI Response Workbook.

4. Foundational Requirements

4.1 Full data ownership: YES

FLiiP holds zero proprietary claim over Gold's member data, schema, or derived outputs. Gold's owns all data contractually; FLiiP's usage rights are limited to service delivery. This is a standard provision in our enterprise agreements.

4.2 Real-time API access: YES

FLiiP exposes three integration surfaces, each suited to different use cases and latency requirements:

1. REST APIs. FLiiP's REST APIs cover the member lifecycle: member management (join, cancel, reactivation), billing, scheduling, access control, and product catalog. This is the primary surface for systems that read or write to FLiiP programmatically, including a Gold's-owned member app and corporate platform connections. Membership freeze is the one lifecycle action not exposed as an API endpoint today. It is a small, well-scoped addition we can prioritize and deliver quickly for Gold's.

2. Business events s. FLiiP emits key business events today (membership status changes, member updates, service changes), currently delivered through Zapier, which covers a broad set of automation use cases. Native webhook delivery straight to Gold's own endpoints, with no Zapier or middleware in the path, is a well-scoped build we can prioritize for Gold's. Middleware-free event consumption is also available today through the data lake (change-data-capture, sub-minute latency) and the REST API, so Gold's can consume live event data directly without a middleware layer.

3. Data lake. The analytics surface: raw operational data (transactions, check-ins, member events) available with sub-minute latency; aggregated business layers refresh hourly by default, adjustable per KPI. Designed for BI tools and data-warehouse consumption (detail in Section 6.3).

In addition, Gold's receives full access to RISE CRM's API (GHL) and webhook surface (lead management, communication workflows, segmentation, campaign automation), independent of the MMS layer.

No operational member data flows are batch-only.

4.3 Multi-location franchise architecture: YES

FLiiP was designed for franchise networks from the ground up: both the MMS and the CRM (RISE) are built around a common principle: templates combined with granular permissions, where every user operates within a defined scope covering one or more locations.

FLiiP MMS - Master platform + inheritance model

Each deployment starts with a master platform (template), defined collaboratively at project kickoff with Gold's corporate team

At launch, every franchisee location inherits from the master platform: which products, memberships, pricing structures, dashboard, configurations … are mandated versus locally adjustable is defined upfront.

Role and permission management is fully configurable at the Gold's level: corporate can choose which business elements a franchisee can edit and which are locked.

Changes pushed at the master level can propagate across the full network or selectively to a subset of locations.

RISE CRM - Snapshot system + permission layer

RISE uses a snapshot model: corporate can build proven workflows, automations, campaigns, and funnel templates, then push them to all locations or a defined subset with a single action.

Each location inherits the snapshot while permissions control what a franchisee can modify locally versus what remains locked at the corporate standard.

The result: Gold's corporate can enforce consistency across the network while giving franchisees enough flexibility to operate effectively in their local market.

Scope-based user access

Across both platforms, every user is assigned a scope: one location, a group of locations, or the full network. A franchisee owner sees only their gyms; a regional manager sees their cluster; corporate sees everything. No configuration required per user beyond scope assignment.

This architecture ensures Gold's corporate can operate as the single source of truth while each franchisee experiences a system tailored to their context, and without managing hundreds of independent configurations.

4.4 Documented data export and migration: YES

FLiiP cooperates fully with any future migration and does not hold data hostage. Export tooling is self-service in standard formats , and Gold's has full access to all its data through the data lake and APIs at any moment, not only at migration. At termination, we commit to full historical export, including custom attributes, at no additional cost. Where Gold's requests migration assistance , that work is scoped jointly with Gold's and delivered at the agreed rates.

4.5 U.S. market support: YES

FLiiP's team is North American (95%+), operating in U.S. time zones. Support coverage: weekdays 4:00 AM to 5:00 PM ET with both technical and support-agent staffing, and 24/7 on-call coverage for urgent issues outside those hours (nights and weekends). Support hours and severity coverage are aligned to peak gym operations and can be structured to Gold's operating profile as part of the partnership. Because implementation is where technology partnerships succeed or fail, FLiiP deploys on-site across North America, organized by territory, providing in-person onboarding where it adds the most value (pilot launches, wave kickoffs, and location go-lives) alongside remote support through the rest of each rollout, with the exact on-site and remote blend scoped with Gold's per wave. U.S. regulatory operations are part of the platform's day-to-day: A2P 10DLC brand/campaign registration for compliant SMS delivery, PCI-DSS payment processing through Adyen, ACH/card rails, and CCPA data-subject workflows (Section 8). Our lead investor is U.S.-based (Cultivation Capital, St. Louis), and our U.S. presence is expanding with the market.

4.6 POS / retail capability: YES

FLiiP's POS is native: built into the platform on the same member record, product catalog, inventory, and payment rails as memberships, billing, and check-in. Every retail sale posts to the member profile and unified reporting; walk-in sales are supported. Inventory is cost-aware per SKU (cost price, ledger account, stock levels, auditable movement history). Card-present terminals (Adyen) run in the same POS session as card-not-present, so members and retail transactions share one account of truth.

4.7 Open ecosystem and headless compatibility: YES

FLiiP operates as an open platform Gold's builds on top of. APIs are first-class. Gold's can integrate third-party CRM, member app, marketing, data and analytics, and PT tools without commercial penalty, support degradation, or roadmap de-prioritization. Openness is core to the architecture (data lake, APIs), not a concession. Customers run their own BI stacks and external CRMs against the FLiiP data layer in production today. We are comfortable serving as the headless system of record while Gold's owns workflows and the member experience; our own branded and white-label apps are built on the same APIs we expose to customers.

Critically, the surfaces Gold's has flagged as essential are already live and production-proven: the sign-up and join-online flows, member account management, check-in, access control, and full data access through the data lake. These are not roadmap items; they run in production now, powering both our own apps and live customer integrations. Our open-platform transition to full

API-first coverage is deliberate and ongoing, but the parts still being completed are back-office modules that fall outside the use cases in your RFI, not the member-experience layer you intend to own. Please find them attached.

4.8 Product continuity and no forced migration: YES

Nothing in the FLiiP product line, including the platform proposed to Gold's, is planned, under consideration, or at risk of sunset, end-of-life, or reduced investment within the next 12 months. There are no consolidation or customer-migration plans. FLiiP commits that Gold's will not be force-migrated to a different platform without Gold's written consent, adequate advance notice, vendor-funded migration, and a no-penalty exit option, and we accept the Section 15.7 protections.

6. Technical, API & Integration

6.1 API Architecture

You can find attached an extract of our API documentation - knowing the tight schedule, we tried to improve your level of understanding by asking AI to adjust some terms/descriptions to match yours, and focus on signature & description. It means that some API might not be exactly the same in production, just to speed things up for this RFI. You can use tools like https://www.openapiviewer.com/ to view it or your favorite tool.

Real-time exchange. External systems (e.g., the Gold's member app) interact with FLiiP through live API calls and webhook events. Data is transmitted at the moment of occurrence, synchronized against the single member record, and updated without scheduled batch processes. Personal-training data and workflows (packages, balances, bookings, session completion) are available through the same surface.

Latency. Average API response time is 180 ms end-to-end under normal operating conditions, served from AWS infrastructure with horizontal auto-scaling; sub-second consistency between platforms is the design target for all operational flows.

Rate limits. Configured at project onboarding to match Gold's use case; they serve as a security guardrail, not a commercial bottleneck. High-volume analytical consumption routes through the data lake, keeping the operational API lean.

Sandbox. A dedicated sandbox environment is available throughout the contract for integration testing, with isolated API keys and full feature parity with production.

Documentation. API documentation is attached. Note on the extract: field names and descriptions in the attached extract were aligned to Gold's terminology for readability; the authoritative production reference is our developer documentation.

6.2 Data Ownership & Portability

Contractual data ownership by Gold's (Sections 4.1 and 15.1). Export formats: CSV, JSON, Parquet, self-service and on demand, plus continuous access through the data lake (S3/Athena) and APIs. Full historical export includes custom attributes, audit histories, and communication logs. At termination, FLiiP commits to complete data return in agreed formats within a defined window and cooperation with the successor system at agreed rates (Section 15.2).

6.3 Analytics & Data Access

1. Data movement. FLiiP provides Gold's with direct access to the data lake rather than relying on push-only or batch-export mechanisms. The architecture is built on a Change Data Capture (CDC) with a Medallion (Bronze/Silver/Gold) model.

- Latency. Raw data (Bronze layer) has a freshness of under 1 minute. Business KPIs (Gold layer) refresh hourly by default, with frequency adjustable per KPI based on business requirements.
- No overnight batch dependency. There is no nightly batch window for analytics-grade data. Processing is event-driven and incremental throughout the day.
- Access options for Gold's. Data can be consumed via: Amazon S3 (Parquet / Apache Iceberg format); Amazon Athena (standard SQL interface over the lake); or file delivery to a Gold's-designated destination (for example, an S3 bucket in Gold's AWS environment), if preferred.
- A Data Catalog acts as the shared metadata layer, registering schemas and partitions consistently across all consumers.

We are open to discussing the best delivery mechanism to align with Gold's unified data layer requirements.

2. Analytics: baked-in vs. third-party. FLiiP offers both options, and they are not mutually exclusive.

- Fully baked-in (default). Analytics and reporting are natively powered by Omni, FLiiP's integrated BI layer. Omni queries curated Gold tables through Athena, providing dashboards, KPI monitoring, operational reporting, and ad hoc exploration out of the box. This means Gold's franchisees are never flying blind from day one. Omni also comes with an AI layer and an AI data catalog, supported by FLiiP.
- Third-party BI (supported). Gold's can also connect their own preferred BI tool (for example Tableau, Power BI, Looker) directly to the data lake via Athena or S3. This is supported natively, with no proprietary lock-in on the consumption layer.

3. Visualization & semantic model. FLiiP's architecture gives Gold's meaningful ownership and flexibility:

Layer	Owner	Details
Raw and cleansed data (Bronze/Silver)	FLiiP operates, Gold's accesses	Queryable via Athena or S3; full schema documented in the Glue Data Catalog
Business-ready datasets (Gold layer)	FLiiP defines and maintains	Curated KPIs, stable business definitions, domain models (membership, revenue, retention, etc.)
BI/visualization layer	Gold's choice	Omni (default, fully baked-in) or any third-party viewer connecting over Athena/S3

Gold's is not locked into FLiiP's visualization layer. The data assets are accessible independently of the BI tooling.

4. Interim-then-replace path. FLiiP is fully aligned with this migration strategy. The data and analytics layer is modular by design.

- Day 1. Gold's operates on FLiiP's data lake and Omni dashboards immediately, with no data blindness during transition.
- Later. As Gold's establishes its own central data warehouse (Databricks, Snowflake, Microsoft Fabric), the data-lake layer can be replaced or bypassed without impacting the MMS operational platform. The data lake is an optional, decoupled module.
- What the transition involves. Redirecting data feeds (CDC stream or S3 exports) from FLiiP's lake to Gold's target warehouse. The Glue Data Catalog schemas and pipeline documentation are available to facilitate this re-pointing.
- No disruption to the MMS. The operational platform (member management, bookings, billing, etc.) is fully independent from the analytics layer. Replacing one does not affect the other.

5. Unified data layer. As described in point 1, FLiiP feeds Gold's central warehouse through the CDC stream and S3 delivery, with schemas documented in the Glue Data Catalog.

6. Data access: full schema, ERD, restrictions. Yes, the full schema of the MMS is available for custom BI analytics. Gold's will have access to all core business entities: users, memberships, studios, bookings, attendance, transactions, and coaching data, as well as enriched CRM data from RISE. Restrictions are minimal and reasonable:

- A small subset of fields is excluded for security or compliance reasons (for example, internal credential fields).
- A small number of deprecated or zero-value fields are excluded to avoid confusion.

7. Data integrity: single source of truth. Yes, the FLiiP MMS database is the single source of truth. This ensures full auditability, historical replay capability, and data lineage that traces cleanly from source to analytics.

6.4 Required & Existing Integrations

CRM (HubSpot). Two supported paths, both first-party (no third-party middleware):

Path A: keep HubSpot as a system of record. FLiiP builds a bidirectional HubSpot integration for Gold's during onboarding, replacing the middleware Gold's uses today. Member events (check-ins, payments, status and plan changes, lifecycle stages) flow to HubSpot in near real time; updates write back.

Path B: migrate workflows into RISE (our recommendation to evaluate). FLiiP's in-house GHL product experts map and migrate Gold's HubSpot drip campaigns, member journeys, and sales workflows into RISE, where 50+ MMS data points are already live-synced, unlocking automations an external CRM cannot easily replicate. FLiiP does the heavy lifting: mapping, challenge and adjust, migrate, beta-phase validation.

We would put both paths in front of Gold's with the trade-offs visible and decide together during discovery.

Member app. Gold's owns the member-app experience (your in-house rebuilt app, or Motion Vibe if retained); FLiiP serves as a system of record underneath via REST APIs.

Gate-control hardware. Access-control agnostic (RFID, NFC, barcode, QR, biometrics). Three certified integrations live in production: Gantner, Passport Technologies, Dragonfly (BETA). We integrate with existing hardware where feasible (typically a controller swap, sometimes the scanner, not a full turnstile replacement) and can add providers by replicating an established integration pattern.

Payment processor. Payments are embedded (Adyen, PCI-DSS Level 1): one processor, one reconciliation view across in-club terminals, online join, and recurring billing. We address Gold's "integrate with, but not own" principle directly in Sections 11 and 6.6: payment tokens are migrated in from incumbent processors during onboarding, and portability/exit terms are contractual (Section 15.2), so the embedded rail increases Gold's control of the money flow rather than reducing it. Real-time royalty and revenue splits at the transaction, product, or service level are supported through the integrated payment layer.

Email / SMS. Native: transactional documents via AWS SES; conversational/notification via RISE (SPF/DKIM/DMARC-authenticated domains, A2P 10DLC-registered SMS, Google Postmaster monitoring).

Unified data layer. CDC, or S3 delivery into Databricks, Snowflake, or Microsoft Fabric (Section 6.3).

In production today (selected):

- Adyen (embedded payments);
- Gantner, Passport Technologies, Dragonfly (access control);
- GoHighLevel (RISE foundation);

- Perkville (rewards). Solution One Partners;
- Google Calendar, ICalendar Sync;
- Google Ads, META ads;
- Collection-agency reporting integrations;
- Docuseal digital signature (final development, August 2026);
- Trainerize (final development);
- Technogym;
- Omni (Bi Tool);
- Zapier.

6.5 Performance Targets

FLiiP's platform API responds in an average of 180 ms end-to-end under standard operating conditions, served from AWS infrastructure with horizontal auto-scaling. This applies to both member join flows (enrollment, contract creation) and check-in validation calls.

Rather than publishing a static ceiling that could become a contractual liability, FLiiP commits to conducting dedicated load tests prior to go-live on the Gold's Gym environment to validate that response times remain within the 180 ms average (< 300 ms p95) under the peak concurrency profile specific to Gold's locations (volume of simultaneous check-ins, member app sessions, and admin operations).

REST API calls from the member-facing mobile app are served with the same target as other APIs.

6.6 Ecosystem Posture (Open vs. Closed)

API as primary interface. Rather than quote a single percentage that could mislead, we are sharing our API documentation directly, mapped to the use cases Gold's shared, so your team can assess exact coverage endpoint by endpoint (attached). Coverage centers on the member lifecycle (join, account management, cancel, reactivation), billing, scheduling, access control, and product catalog, all consumable via public REST API today. These are the surfaces a Gold's-owned member experience and corporate integrations depend on. Some back-office and administrative configuration functions are currently admin-UI, and our open-platform transition to full API coverage with key webhooks is active and deliberate, closing those over time. The one member-lifecycle action not yet exposed as an endpoint is membership freeze, which we can prioritize and deliver quickly for Gold's (see Section 4.2). Gold's also has access to the full RISE CRM API surface through the GHL marketplace, independent of the MMS layer.

Headless / system-of-record mode. Yes. This is the model we propose for Gold's: Gold's hosts the member-facing UI (join, account portal, freeze/cancel, payment management) and FLiiP operates as transaction engine and system of record. Our own branded and white-label apps run on these same APIs in production. A few multi-location operators are currently exploring this same headless approach with us, so while Gold's would be first to production at this scale, this is a direction we are actively building toward with the market.

FLiiP is in advanced discussions with multiple multi-location and franchisor operators evaluating a network-wide standardization on FLiiP, reflecting accelerating traction with larger brands.

API pricing and metering. APIs and Datalake load are included in the base subscription at fair use: no per-call metering, no separate commercial tier for API access. High-volume analytical workloads route through the data lake (included). Rate limits are engineering guardrails set with Gold's at onboarding, not revenue levers, and Section 15.6 protections (no unilateral degradation) are accepted.

Webhook and event coverage. The event mechanism is described in Section 4.2, and the current event catalog is included in the attached API documentation. In summary: FLiiP emits business events for membership status changes, member updates, and service lifecycle changes, delivered through Zapier today, with native direct-to-endpoint webhooks a well-scoped build we can prioritize for Gold's. Building new webhooks is also part of our current roadmap strategy, so the coverage will increase over time.

Third-party integration policy. Open by default: integrations built on documented APIs require no approval or marketplace fee. Categories: self-service (API consumers, BI tools), partner-built (access control, payments-adjacent), custom-built by FLiiP on request. No categories are blocked. Example customers: a hospital-affiliated enterprise running FLiiP integrated with its ERP and existing BI; an operator running Zoho CRM as sales system of record.

Adjacent-module pricing pressure. Adjacent-module pricing pressure. None. The per-location price is all-inclusive: MMS, RISE CRM, and analytics/BI are one number, not separately metered modules. If Gold's chooses third-party tools in adjacent categories (CRM, member app, marketing, PT, analytics), pricing, support tier, SLA, and roadmap prioritization do not change, and there are no bundle mechanics that penalize best-of-breed choices. Because RISE CRM is already included in the base price, Gold's can consolidate onto it and retire the separate HubSpot subscription at no incremental FLiiP cost. That saving is Gold's to keep, not a paid add-on.

Customer customization without professional services. Admin users create custom fields, membership/plan configurations, dashboards and reports (self-serve BI; a custom KPI dashboard takes under five minutes), communication templates and automation workflows (RISE), and API-based integrations, all without FLiiP professional services. Professional services are optional accelerators, not gates.

Vendor use of customer data. Gold's data is used for service delivery only. No flow into shared analytics, vendor benchmarking, AI/ML training, or product-development datasets without explicit written consent; opt-out is complete and contractual (Section 15.1 accepted).

UI replaceability. Join, account management, billing/payment update, freeze, cancel, and check-in confirmation are all replaceable by a Gold's-built UI on FLiiP APIs.

Exit. Operationally: full export (CSV/JSON/Parquet) plus data-lake access through the transition; payment-token portability per card-network rules; documented schemas (Glue catalog); cooperation with the successor at agreed rates. Gold's-built UIs, workflows and integrations are Gold's property and leave with Gold's.
On comparable-scale exits, the honest explanation is retention, not lock-in: FLiiP has low churn, our customers stay, and our largest relationships are in active growth rather than transition. No customer at Gold's scale has exited FLiiP in the last 24 months, because our large customers have not wanted to leave. The largest completed departure was a roughly 10-location operator (Fitness Boutique), handled cleanly with full data return and no dispute. We would rather state that plainly than imply an at-scale exit we have not run.

Retention does not come at the cost of freedom to leave. The core reason is architectural: because Gold's data is continuously accessible through the open data lake and self-serve export in standard formats (CSV, JSON, Parquet), including delivery to Gold's own environment, it is never trapped in the first place. An exit is a redirection of feeds and a final export, not a recovery project, and FLiiP commits contractually to full data return and cooperation with the successor system (Section 15.2).

6.7 Innovation

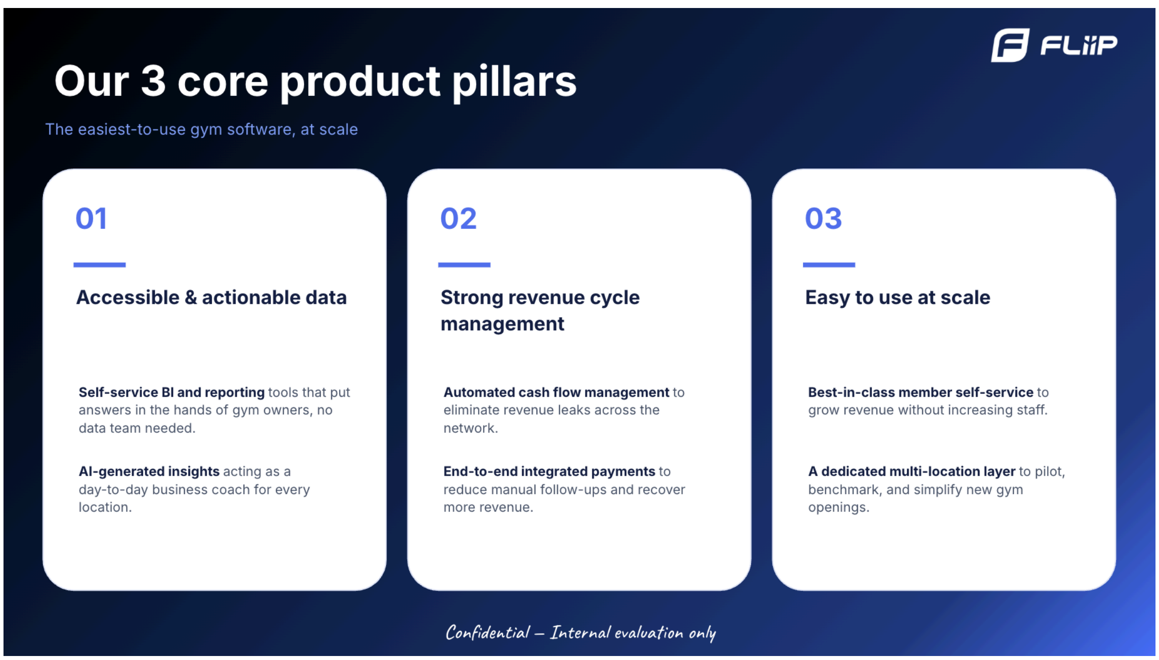
Delivered product roadmap, last 12 months (August 2025 to July 2026)

Over the past year FLiiP shipped across payments, access control, data and analytics, AI, and compliance. Selected deliveries by area:

- **Payments and revenue cycle management**. in-person Adyen terminals; Smart Payment Retry / Auto-Rescue; a new transaction detail panel surfacing recovery status, decline reason, and a full activity log; a daily Adyen reconciliation dashboard; and integrated POS ("cash register") capability.
- **Access control and check-in**. Real-time check-in went live, making FLiiP the front-desk interface, including a new Chrome extension for staff with always-visible check-in. integrations with Gantner and DragonFly (biometric), plus zone management (assigning access zones to memberships or add-ons, multiple devices per zone, with safeguards against removing a zone or device in use).
- **Data and analytics.** The data lake reached its first production version on a Medallion (Bronze/Silver/Gold) architecture now powering both BI and AI. FLiiP Analytics (powered by Omni) shipped as an AI-driven, multi-location analytics layer with natural-language querying ("prompt your data"), AI summaries, a no-code dashboard and report builder, and scheduled alerts. Multi-location dashboards were deployed to production with updated, consolidated franchise views, and the new no-code builder reduced dashboard and report creation from months to about a week.

- **AI.** The Churn Prevention AI, developed through the Google AI Accelerator, member-level risk explanations. The FLiiP Intelligence agent layer launched in July 2026, and a mobile AI coaching capability is in development.
- **Member lifecycle and compliance.** We delivered waivers with e-signature for US compliance, deployed US cancellation-policy compliance, and released advanced custom-role configuration for enterprise access control.
- **Platform and reliability.** Platform reliability held at 99.999% uptime through infrastructure modernization and improved monitoring.
- **Compliance.** Delivered the NF525 certification.

Roadmap through 2027 (Selected)
FLiiP plans and ships on a quarterly roadmap, with a defined share of engineering capacity reserved each quarter for partner-driven priorities. Enterprise partners like Gold's get a seat at that table, and your needs feed directly into prioritization (see Section 12.5). The roadmap is organized around three durable product pillars, and the items below are grouped accordingly.



1. ***Accessible and actionable data***. Agent Studio to build, deploy, and monitor AI agents on the data lake and APIs; expansion of AI-generated insights acting as a day-to-day business coach for every location; and continued growth of data-lake coverage and self-service analytics.
2. ***Strong revenue cycle management***. Pre-debit ACH validation (targeted Q4 2026); freeze-rate billing during membership suspensions (Q4 2026); a Dispute Agent that assembles chargeback responses automatically; and continued expansion of automated recovery across payment methods.

3. ***Easy to use at scale***. Digital signature general availability (August 2026); a member-app UX/UI overhaul with expanded white-label customization (Q4 2026); and continued API-first expansion so more of the platform is consumable headlessly, including the member-facing surfaces Gold's intends to own.

Dates are targeted, and sequencing is co-planned with Gold's as part of the partnership.

Sandboxes / regression testing. Yes, a dedicated sandbox with feature parity is available throughout the contract. For custom development built for Gold's, the sandbox supports full end-to-end regression testing: Gold's validates each custom build in the sandbox before it is promoted to production. For standard platform releases, FLiiP is a single-codebase multi-tenant SaaS on continuous delivery, so those releases are validated through FLiiP's own staged pipeline (test, preprod, production) and automated regression gates rather than being handed to each customer for pre-release regression testing. No releases run during defined peak windows (Section 9.3), so release risk is controlled even where standard releases are not individually customer-gated.

Release previews and update deferral. FLiiP is a single-codebase, multi-tenant SaaS on continuous delivery, so all locations always run one current, consistent version. There is no per-customer version pinning, and standard releases are not individually deferred at a customer's request. This is deliberate: it is the same consistency model that eliminates the version fragmentation Gold's is working to remove across its network, and it keeps every location on the latest secure, supported release. Release risk is managed through feature flags (phased enablement per account or network), a staged pipeline (test, preprod, production) with automated regression gates, and no releases during defined peak windows (Section 9.3). If Gold's requires additional release-timing controls aligned to its business calendar, we are open to scoping an appropriate mechanism together in the proposal (RFP) phase.

CI/CD & SDLC. CI/CD and SDLC. FLiiP runs a structured, tooled SDLC. Work is tracked in Jira (Epics and user stories, with ideas captured in Jira Product Discovery) and built on GitHub with a feature-branch, pull-request model. Every pull request requires a minimum of two peer approvals and must pass automated quality checks before merge. Changes flow through a CI/CD pipeline and a three-tier environment path (staging, then pre-production, then production), with automated regression testing plus targeted manual regression run before each release. Controlled rollout is enforced through feature flags, documented and tested rollback procedures, and post-deployment monitoring (Datadog) with automated anomaly alerts. Definitions of Ready and Done gate what enters testing and what ships, so quality and traceability are built into the workflow rather than bolted on at the end.

Cooperative development. FLiiP builds customer feedback into every phase. Pre-development: support-ticket analysis, feature prioritization by user impact, user-story mapping with stakeholders. During development: beta-testing programs for select customers, feedback during pre-production testing, Customer Success input on implementation. Post-deployment: feedback monitoring, usage analytics to validate adoption, continuous improvement. For Gold's specifically: a seat at prioritization (Section 12.5), participation in beta and pre-production validation of Gold's-specific builds, and a direct feedback loop from your teams into the roadmap.

Architecture and process enabling innovation.. FLiiP is cloud-native and data-friendly, built around a single source of truth: one member record on serverless, horizontally auto-scaling AWS infrastructure, with a modular design where the data lake is decoupled from the MMS. AI runs as a layer across the platform on an LLM-agnostic abstraction with evals, so models are swapped monthly for cost or performance without touching the agents, and the analytics layer can be replaced without disrupting the operational core. But innovation at FLiiP is not only architectural, it is a product-process advantage: a structured, tooled SDLC with AI embedded in the build process itself, plus a quarterly roadmap with capacity reserved for partner-driven priorities, lets us move from idea to production quickly and safely, around real operator needs rather than guesswork.

Development process. Five stages: (1) Requirements and planning: ideas in Jira Product Discovery, scoped as Jira Epics with business-impact and user-needs analysis, resourced through sprint capacity planning. (2) Design and specification: detailed specs on a Confluence Epic template, architecture decisions, UI/UX requirements, dependency and integration mapping. (3) Development: feature branches (US-{ticket} convention), coding standards, ticket-referenced commits, pull-request peer review. (4) Verification and validation: CI/CD automated testing, manual QA on dedicated environments, code-quality validation . (5) Deployment and monitoring: staged deployment with Datadog monitoring and customer-feedback collection. Cadence includes sprint planning, backlog grooming with risk assessment, and quarterly retrospectives. Authorization scales with change magnitude: minor fixes need a developer plus two peer reviews; feature changes need Product Owner approval plus technical review; architectural changes need technical-lead and stakeholder approval.

Where we most need improvement. Candidly: member-facing engagement features (challenges/leaderboards) exist as operator-side reporting but not yet as an in-app member experience; a scoped build is offered above.

Customer-specific customizations. Yes. Most of the time it's integration, key dashboards. Examples; Perkville, Solution 1 Partner (Gold's Gym), custom reporting/royalty structures for franchisors.

7. Franchise & Multi-Tenant Architecture

7.1 Centralized Data, Decentralized Execution

Corporate sees and reports on the full network (consolidated dashboards, location benchmark tables, drill-down to any club); each franchisee sees and controls only their own locations. Reporting scope is enforced at the data level by role, with no manual filtering. Confirmed: there are no direct vendor-to-franchisee consumer apps that bypass Gold's-controlled surfaces.

Member-facing experiences run under Gold's brand and account, and FLiiP does not market to Gold's members.

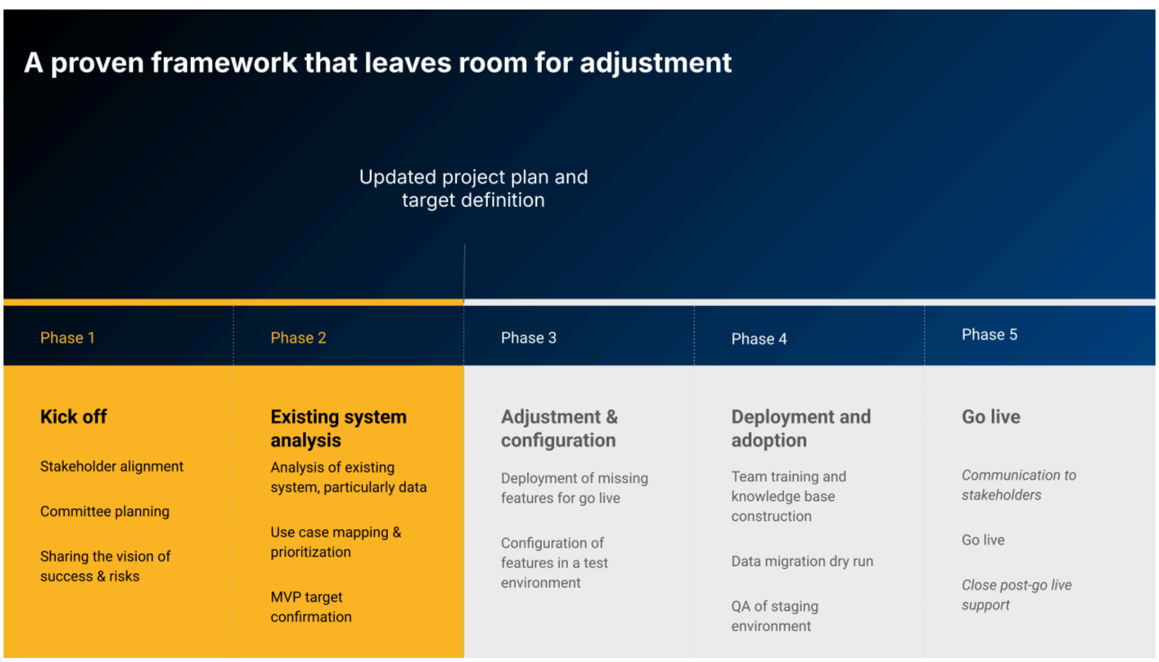
7.2 Configuration Hierarchy

As described in 4.3, Corporate-enforced settings (brand standards, required disclosures, payment terms, plan templates, communication templates, lifecycle rules) are locked at the franchisor level and propagate network-wide through Snapshots; franchisee-local overrides (pricing within corporate-set bounds, promotions, hours, local marketing) are granted by permission. The boundary between mandatory and optional is itself configurable (globally, per country, per region, or per location) and versioned for audit.

7.3 Scale & Onboarding

These are default onboarding phases, based on the internal playbook. Specific timelines and phases will be to rebuild together depending on the implementation strategy and what needs to be true for the first go live.

Here is the general framework :



Proposed wave structure (indicative, co-planned at kickoff against Gold's timeline)

Phase 0, Foundation: discovery, architecture, MoSo migration blueprint and data audit, integration builds (access control, CRM path, data-lake feed), Gold's sandbox.

Phase 1, Corporate pilot: one corporate location live with the incumbent running in parallel until verified stable; then a three-location wave to prove the migration recipe repeats. Exit criteria: data-integrity reconciliation, a clean full billing cycle, check-in stability.

Phase 2, Corporate scale: remaining corporate clubs (40-50 total) in weekly cohorts ramping from 3-5 per week toward 10 per week. One incumbent (MoSo) and one decision-maker means one migration script replicated at scale.

Phase 3, Franchise waves: franchisees (130-140) grouped by incumbent provider (ABC, ABC Peak, MoSo, others): one migration recipe per provider, built once, reused across its cohort. Sequencing driven by incumbent contract expiry plus first-come-first-served within each cohort, so early adopters create pull. Pace adjustable to Gold's change-management capacity.

Evidence at scale: largest comparable deployment is a 250-location international franchise across 10 countries: 170 locations onboarded in the first 6 months (10 locations per week in cohort mode). Reference available (Section 12.3). Gold's Gym Québec was live 40 days from signature (both locations, from a 13-year ABC environment). Implementation capacity for concurrent onboardings is committed per wave plan at kickoff.

7.4 Brand Standard Enforcement

Brand standards are enforced through locked Snapshot templates (plans, pricing bounds, member communications, join flows, disclosures) while franchisees keep autonomy inside corporate-defined lanes: local pricing within bounds, local promotions, local schedules and staffing. Central changes push network-wide in one action with version history: standardization without removing the franchisee's ability to run their business.

8. Security, Compliance & Data Privacy

Certifications. Payment processing is PCI-DSS Level 1 via embedded Adyen. SOC 2 Type II is in progress and attestation targeted in the next 12 months. FLiiP operates in full GDPR compliance today, the global benchmark for data protection, validated by an active EU customer base.

Privacy. FLiiP's privacy program is built on GDPR, and U.S. state privacy regimes such as CCPA are addressed within that framework: CCPA is a GDPR-derived regime, and the same controls satisfy its core requirements: data-subject access, correction, and deletion workflows (including hard-delete of stored payment methods), and consent capture and revocation per channel (email, SMS, voice) with source and timestamp on the member record, propagated instantly to all downstream automations. On health data: FLiiP is not a HIPAA covered entity or business associate and does not knowingly process or store Protected Health Information; the platform manages fitness operational data only. PII is protected by the controls below.

Data residency & encryption. FLiiP operates across U.S. and Canadian AWS regions today. For Gold's, FLiiP will commit to U.S. data residency, with all Gold's production data hosted in U.S. AWS regions, structured contractually. Encryption at rest (AWS KMS) and in transit (TLS)..

Customer-managed keys are not offered today; where required, this can be scoped as part of the contract discussion.

Access controls. Role-based access at individual-permission granularity; corporate vs. franchisee separation enforced at the data level; member-data access and staff actions logged . Single sign-on into the FLiiP admin console is not native today; SSO is available as an option through RISE.

Incident response. Documented incident-management framework with defined roles (Incident Manager, Communications Officer), internal escalation channels, customer notification by email and public status page (status.fliip.io), post-incident reviews and post-mortems. Specific breach-notification commitments and timing will be finalized in the RFP and contract phase. Previous security incidents will be disclosed in the RFP phase.

Accessibility. Candidly, FLiiP's member-facing surfaces are not yet conformant to WCAG 2.1 AA. If accessibility conformance is a requirement for Gold's, FLiiP is willing to scope an accessibility roadmap toward WCAG 2.1 AA for the member-facing surfaces as part of the engagement.

9. Service Levels (SLA)

9.1 Uptime

Committed uptime: 99.9%, - you can check current statistics at https://status.fliip.io/.

9.2 Response & Resolution by Severity

FLiiP's standard severity model:

Priority	Definition	First response	Resolution / de-escalation	Compliance
P1 (Critical)	Service down; billing or check-in unavailable; security issue	Under 1 hour, 24/7 via emergency hotline	1 hour	95%+
P2 (High)	Significant impairment of a key function, no workaround	Under 8 hours	24 business hours	90%+
P3 (Medium)	Isolated issue or non-critical function	Under 24 hours	Next release	85%+
P4 (Low / question)	Information request, suggestion	Under 48 hours	Case by case	80%+

This is a standard severity model. For P3 & P4, exceptions are possible depending on the priority alignment with the franchise.

P1 incidents are worked 24/7 regardless of business hours. Monthly SLA reporting: uptime with incident detail, ticket volumes by priority, response/resolution times, compliance percentages, and improvement actions. Severity definitions will be finalized with Gold's during contracting.

9.3 Maintenance Windows

FLiiP performs all scheduled maintenance during **off-peak hours only**, with **advance notice provided to all affected clients**.

Commitments:

- No scheduled maintenance during defined peak gym hours (to be co-defined with Gold's as part of onboarding).
- Advance notice of scheduled maintenance windows (minimum 48-72 hours for standard; earlier for significant changes).
- Emergency/urgency exceptions apply: in the event of a critical security vulnerability or active incident, FLiiP reserves the right to deploy emergency patches outside scheduled windows. In such cases, clients are notified immediately and the maintenance is tracked in the public status log.

9.4 Disaster Recovery

FLiiP maintains robust disaster recovery procedures:

- Recovery testing frequency: FLiiP conducts recovery testing twice per week, ensuring our procedures are validated continuously, not on a quarterly or annual basis.
- Backup frequency: Databases are backed up on a continuous/incremental basis, with full snapshots performed daily.
- Geographic redundancy: yes for the MMS, managed by AWS.
- RTO and RPO: Specific numerical targets for Recovery Time Objective (RTO) and Recovery Point Objective (RPO) will be formally stated in the RFP response, where they will be committed contractually based on Gold's operational requirements.

9.5 Service Credits

FLiiP is open to contractual service credit structures for missed SLAs. The specific credit model (percentage of monthly fees, thresholds, caps, and calculation methodology) will be negotiated and formalized in the RFP phase, where we can structure a credit framework that reflects the severity, duration, and business impact of any breach.

We view service credits not as a liability disclaimer, but as a mutual accountability mechanism that aligns our incentives with Gold's operational success.

10. Implementation, Migration & Change Management

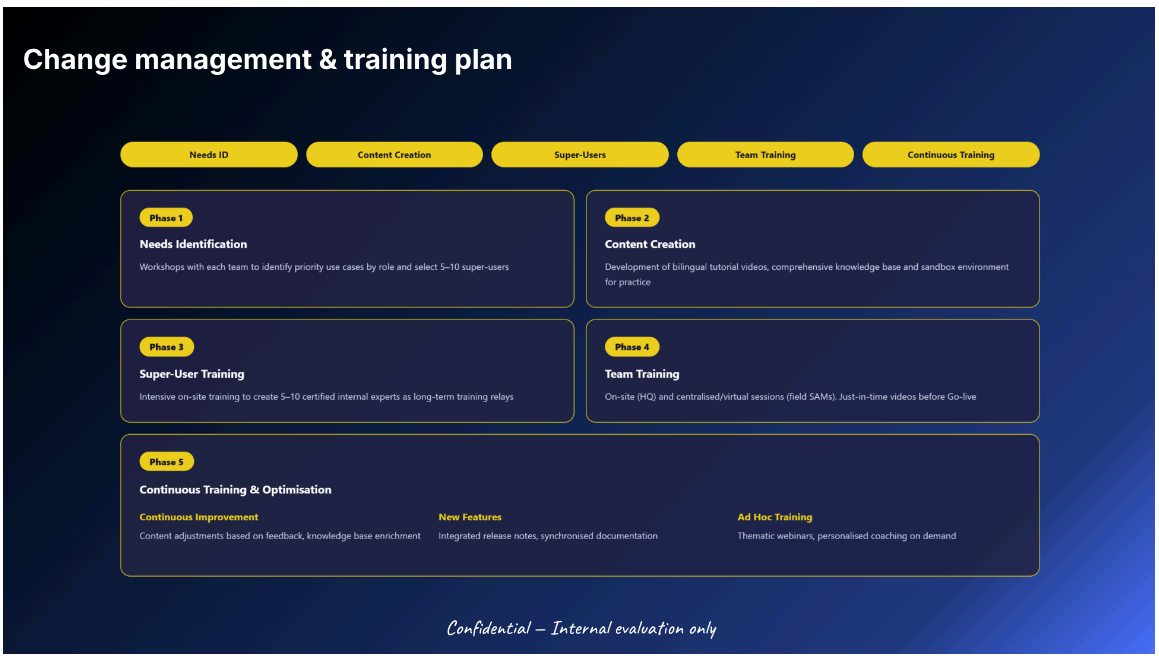
10.1 Phased Rollout

Pilot, then corporate waves, then franchise waves, with the incumbent running in parallel until each wave is verified stable. Full structure and timeline in Section 7.3. Go/No-Go gates at each phase boundary with defined exit criteria.

10.2 Vendor-Led Data Migration

FLiiP has transitioned operators from dozens of different providers, with purpose-built playbooks, tooling, and provider-specific migration scripts (including ABC, Mindbody, Jonas, Gym Master and other legacy systems). Scope: member master, agreement/contract history with grandfathered pricing preserved, transaction history, payment tokens (processor-to-Adyen token migration where the incumbent supports export, field recapture as fallback), freezes/pauses, custom attributes, and historical reporting data into the data lake. Method: data audit; mapping matrix and transformation rules (versioned scripts); 2+ dry runs (first anonymized, then full PII in pre-production); integrity validation by statistical checks and financial reconciliation (revenues, balances, payment histories); UAT on migrated data; go-live with rollback protection (incumbent parallel run until the wave passes its gate.

10.3 Training & Change Management



FLiiP delivers training and change management as a structured five-phase program, adapted to Gold's roles and rolled out per wave.

Phase 1, Needs Identification. Workshops with each team to identify the priority use cases by role and select 5 to 10 super-users per wave.

Phase 2, Content Creation. Development of key tutorial videos, on top of the existing comprehensive knowledge base, and a sandbox environment where staff practice without risk. Role-based virtual training and certification could be delivered through the native LMS in RISE (built on GoHighLevel), an existing capability we configure to Gold's workflows during onboarding: dedicated tracks per role (front desk, personal trainers, GM, franchisee owner, corporate admin, finance, corporate analyst) with Gold's-specific use cases, completion questionnaires, and certification on completion.

Phase 3, Super-User Training. Intensive on-site training that certifies 5 to 10 internal experts per wave as long-term training relays, so Gold's builds its own in-house training capacity rather than depending on FLiiP indefinitely.

Phase 4, Team Training. On-site sessions at HQ plus centralized and virtual sessions for field staff, with just-in-time videos available before each go-live.

Phase 5, Continuous Training and Optimization. Content is adjusted from feedback and the knowledge base is enriched over time; new features arrive with integrated release notes and synchronized documentation; and ad hoc thematic webinars and personalized coaching are available on demand.

The LMS content (videos, articles, quick-reference guides, and certification tracks) remains available for every new hire, so training becomes standing franchise-onboarding infrastructure rather than a one-time event. Gold gym can also adjust and create content on this LMS platform.

10.4 Franchisee Adoption Playbook

Adoption is earned, not mandated, and our rollout model is built on it: provider-grouped cohorts with first-come-first-served sequencing create pull from early adopters; franchisee-facing onboarding support (in-person where needed, by territory); dedicated CSM continuity after go-live. Case studies from comparable networks: a 250-location international franchise (independent operators, 10 countries) onboarded 170 locations in 6 months on this exact model; Gold's Gym Québec, a franchisee that chose FLiiP, was live in 40 days from a 13-year incumbent stack and is referenceable on both the transition and the ongoing experience. FLiiP supports Gold's-led change management with materials, webinars, and on-site presence at wave launches.

10.5 Project Staffing & RACI

FLiiP commits a dedicated core team with PM continuity through go-live: executive sponsor and solution architecture (Thomas Albisser, COO/CTO, Gold's technical counterpart), Day-to-day lead of Customer Success (Rosalie Gendreau), enterprise partnership lead (Li Webber), plus a named project manager, functional analyst, data/migration engineer, integrations lead, QA lead, and dedicated CSM assigned at kickoff. Supporting organization (~60 employees, 95% North America). Individual profiles and tenure are provided at the finalist stage; the escalation path runs from CSM to project manager to Thomas (COO) to David (CEO). A full RACI across FLiiP, Gold's, and the StackHack project team is a Phase 0 deliverable.

11. Commercial Posture (Narrative)

Pricing model overview. FLiiP's model is deliberately simple, with a small number of components:

1) **Per-location SaaS license,** all-inclusive: MMS, RISE CRM, analytics and BI, member self-service, API access at fair use, standard support and CSM. Priced per active location, with no per-member fees and no module metering.
2) **Implementation & migration services:** a one-time fee. Franchisee onboarding is a one-time fee per location or cohort (discovery, configuration, integrations, training, go-live support). The larger corporate migration is scoped as its own one-time project, including coordinated data migration at scale, and typically staged 20% / 40% / 40% against milestones (signature, migration testing, go-live).
3) **Payment processing:** embedded Adyen, comprising a blended per-transaction rate (by card and ACH mix and volume) plus standard payment-account and terminal components. Negotiated against Gold's volume in the RFP round.
4) **Communications usage:** SMS, email, and voice at cost-based usage rates, bundleable by volume. US SMS also requires one-time A2P 10DLC brand and campaign registration, a mandatory carrier requirement rather than a FLiiP fee.
5) **Usage-based features:** digital signature, and the AI suite (Analytics AI, Churn Predictor, AI Receptionist, AI Conversation, AI Reputation), each billed on usage. AI Receptionist and AI Conversation also carry standard communication fees (voice and SMS) on top of the AI processing fee.

Two structural points that matter at franchisor scale: First, FLiiP does not keep members' decline, late, or collection fees as vendor revenue, a known friction point with incumbent platforms; that economics flows to Gold's (see revenue share below). Second, **the platform is built to make the franchisor a revenue participant, not just a cost center.**

Total cost of ownership. Yes. FLiiP commits to a complete, A-to-Z five-year TCO in the proposal round: all recurring and one-time fees, professional services, communications, payment economics, and optional and menu items, with nothing omitted.

API & integration economics. APIs are included in the base subscription at fair use, with no per-call metering and no event-stream charges. Gold's can connect its own tools through the documented API with no marketplace fee or usage penalty. Where Gold's asks FLiiP to build a specific custom integration, that development is scoped as one-time professional services and quoted in advance. Section 15.6 protections accepted.

Member technology fee / revenue share. Yes. FLiiP will support, white-label, and revenue-share on Gold's member technology fee. Building on the second structural point above, we propose modeling these franchisor revenue streams together in the deep dive:

- Revenue share on subscriptions across the network
- Revenue share on online enrollments
- Revenue share on AI tools (AI receptionist, AI chatbots, and some other AI features)
- Revenue share on access control
- Decline, late, and collection fee economics: unlike incumbent platforms that keep these member fees as vendor revenue, FLiiP takes none of them, and that economics flows to Gold's as franchisor

The structure should be a win-win-win across Gold's corporate, franchisees, and FLiiP.

What's negotiable. Per-location SaaS license, payment-processing economics (volume and mix based), revenue-share structure and splits, implementation fees against volume commitments and wave cadence, and term structure.

12. Vendor Qualifications & References

12.1 Company Background

Founded 2015 (Montréal) by a gym operator; today ~60 employees, 95% North America, serving 1,500+ customers across 10+ countries with 100% year-over-year growth. Venture-backed by Cultivation Capital (US) and Boreal Ventures (CA) and financially stable. The board includes Tim Stern (General Partner, Cultivation Capital) and Jim Texier (Founding Partner, Framework.vc); strategic advisors include JD St-Martin (General Partner, Boreal Ventures; former President of Lightspeed) and Jona Georgiu (former EVP, Payments). Selected for the Google for Startups AI Accelerator (2025).

12.2 Comparable Deployments

- **International franchise (250+ locations, 10 countries):** franchise platform standardization at scale; 170 locations onboarded in the first 90 days; migrated from the prior provider; 50% network growth since deployment.
- **Franchise network, 50 locations (North America)**: currently in transition to FLiiP from Perfect Gym; cohort-based migration in progress in parallel with our other network deployments.
- **Gold's Gym Québec (2 locations, 5,000+ members):** replaced a 13-year ABC stack (ABC + Gym Sales + Trainerize consolidated into FLiiP + RISE); live in 40 days from signature.

12.3 References

- **Reference 1, Gold's Gym QC:** Sio Khayami, CEO. 2 locations; ABC-to-FLiiP transition and ongoing operations. Willing to take calls.
- **Reference 2, international franchise (250+ locations, 10 countries):** CEO-level contact; comparable in franchise model. Named contact provided at the finalist stage.
- **Reference 3:** Many other references available once we reach the RFP stage.

Named contacts for anonymized references are shared at the finalist stage; Gold's may contact references directly, and we ask for 24 hours' notice as a courtesy to our customers.

12.4 Implementation Team

FLiiP commits a dedicated core team with continuity through go-live, and a staffing model that scales with Gold's rollout rather than a fixed roster. Named leadership, directly involved from day one:

- Thomas Albisser, COO and CTO: executive sponsor and solution architecture; Gold's technical counterpart through the engagement.
- Rosalie Gendreau, Lead of Customer Success. Day-to-day Gold's relationship. A former GM from the Industry, with 5+ years of experience as CSM. .
- Li Webber, enterprise partnerships: commercial and partnership lead.

The delivery team scales by phase, matched to the wave plan (Sections 7.3 and 10.1):

Phase 1, Corporate rollout: executive oversight (above), one to two lead project managers with continuity through go-live, a solutions engineer, a data and migration engineer, a QA lead, and a Customer Success lead.

Phase 2, US franchisee onboarding: additional project managers, onboarding specialists, and CSMs added by territory and cohort, so multiple franchisee onboardings run concurrently without drawing down the corporate team.

Phase 3, network and international alignment: regional leads for multi-market configuration, should Gold's extend the platform across its broader network.

Full individual profiles, tenure, and relevant prior projects are provided at the finalist stage. PM continuity through go-live, the escalation path, and a full RACI are detailed in Section 10.5.

12.5 Product Roadmap

Customer feedback drives prioritization through co-construction: enterprise partners get a seat at the roadmap table, dedicated tactical development bandwidth, and beta access. Current investment concentrations: AI/ML (agent suite, churn prediction, analytics AI layer; FLiiP was one of roughly 10 companies selected for Google's AI Accelerator) and mobile (member-app overhaul, Q4 2026).

Ecosystem strategy, stated directly: FLiiP is a platform customers extend with their own tools and UIs. We fit your architecture; you do not fit ours. The all-in-one capability exists for operators who want it, but every layer (CRM, app, BI, access control) is optional and replaceable.

12.6 Product Continuity & Sunset Disclosure

Sunset disclosure: No products, platforms, modules, or feature sets, including the platform proposed to Gold's, are planned for, under consideration for, or at risk of sunset, end-of-life, deprecation, or reduced investment within the next 12 months. Status of the proposed platform: committed long-term investment vehicle. The Q4 2026 member-app refresh is an investment in the existing product, not a replacement or migration.

Platform consolidation / forced migration: No plans, in progress or under consideration, to migrate or consolidate customers between platforms within the next 12 months.

History (36 months): FLiiP has not sunset a product or required customers to migrate platforms.

The product Gold's would buy is the platform we are investing in long-term. It is not on a convergence path with any other product.

Accountability: We confirm willingness to stand behind these answers contractually via Section 15.7, incorporated as binding representations.

15. Contract Terms: Acknowledgment

FLiiP has reviewed Sections 15.1 to 15.7 and accepts them as the negotiation baseline for the proposal round, specifically including: Gold's data ownership with no vendor use for product development, model training, or benchmarking without written consent (15.1); data return and successor-system cooperation at termination (15.2); API and integration-access protections against unilateral degradation (15.6); and the product-continuity and no-forced-migration protections (15.7), with Section 12.6 representations incorporated by reference.

Appendix C: Foundational Requirements Summary

#	Requirement	Yes / Partial / No	Notes
4.1	Full data ownership (contractual)	Yes	Standard enterprise provision; Section 15.1 accepted
4.2	Real-time API access (REST + webhooks)	Yes	REST v1/v2 + webhooks Zapier (or any other system)+ sub-minute data lake
4.3	Multi-location franchise architecture (native)	Yes	Level hierarchy, Templates, Constraints, Permissions, Scope; 250-location franchise in production
4.4	Documented data export & migration	Yes	CSV/JSON/Parquet self-serve; continuous lake/API access
4.5	U.S. market support	Yes	Weekdays 4 AM-5 PM ET + 24/7 urgent on-call; U.S. data residency committed
4.6	POS / retail integrated or tightly coupled	Yes	Native POS on the same member record and payment rails
4.7	Open ecosystem / headless compatibility	Yes	APIs first-class; no commercial penalty for third-party tools
4.8	Product continuity & no forced migration	Yes	No sunsets or consolidations planned; Section 15.7 accepted

Attachments & Proposed Next Steps

Attachments:
(1) RFI Response Workbook (tabs 5.1-5.14)
(2) API & Webhook documentation extract + developer/Swagger access
(3) PCI-DSS 4.0.1 responsibility matrices (e-commerce + POS/E2EE)
(4) Our presentation Deck

Proposed next steps (per our July 8 discussion): a walkthrough with Rick, Ryan and Mike on a Gold's-representative environment (join flows, memberships, API documentation); a technical deep-dive session on APIs, member-app integration and the data lake with Gold's team; and a departmental discovery/demo cycle per Section 13.2, which we are ready to schedule immediately.
