

Gold's Gym MMS RFI — Sport Alliance Response

RFI: GG-2026-MMS-RFI-001 ·

Respondent: Sport Alliance LLC (Boston, MA) — PerfectGym Next ·

Due: July 10, 2026

Section 4 — Foundational Requirements

4.1 Full data ownership — Yes. All member data, schema definitions, derived data, and outputs generated in PerfectGym Next belong to Gold's Gym. Sport Alliance holds usage rights strictly for service delivery, benchmarking, product development, and model training.

4.2 Real-time API access — Yes. PerfectGym Next comes with full access to our Open API: REST APIs plus a webhook event system for event-driven, real-time synchronization. Documentation is public at developer.sportalliance.com (API reference and webhook catalog). Core operational flows (member, membership, booking, check-in, billing events) are real-time; analytics-grade data to the data warehouse follows a separate pipeline which delivers data in real-time as well.

4.3 Multi-location franchise architecture — Yes. The platform was designed for multi-facility operators from the ground up, not retrofitted. Sport Alliance operates 12,000+ facilities including 130+ international chains and 14 of Europe's 30 largest operators; our largest networks (e.g., RSG Group with McFit, John Reed, and Gold's Gym in Europe) run hundreds of locations on centralized brand-level configuration with location-level execution. We also service the largest franchises all over Europe with more than 500 facilities and multi-country operations (clever-fit & L'Orange Bleue for example)

4.4 Documented data export & migration — Yes. The platform includes a standard data export that an administrator triggers directly from the settings area, on demand and without vendor involvement. It produces a complete download for migration purposes as a zip archive of XLSX and JSON files, including the documents held in document storage. Beyond this packaged export, the documented data warehouse provides access to the underlying data in raw form at any time, so Gold's can extract full historical data in the structure it needs. One candid format note: the standard export delivers XLSX and JSON rather than CSV or Parquet; raw tabular data is accessible through the warehouse. On migration cooperation, the position is simple: Gold's owns the data, so supplying it for a transfer is a legal obligation we accept and anchor contractually, not a courtesy. Migrations away from our platform are rare, but in the small number of cases that have occurred we have always cooperated fully, and we commit to the same for any future migration.

4.5 U.S. market support — Yes. Sport Alliance LLC is our dedicated U.S. subsidiary, headquartered in Boston and backed by the Hamburg-based group (~400 FTE globally, PSG Equity investment). Through our Boston office and senior product people onsite, we have direct exposure to the U.S. market, and that proximity shapes how we build for it: the platform has been fully adapted to U.S. requirements, U.S. payments (ACH, card) run through Finion Pay, and hosting runs in our AWS data centers in the United States. Support hours follow our standard SLA and are aligned to U.S. business hours. With global offices in Boston, Hamburg, Warsaw, and Melbourne, we also provide strong timezone coverage for extended support hours.

4.6 POS / retail — Yes. Retail POS is a native module of the platform sharing one member account of truth: POS transactions can be initiated directly from the member profile, appear in member billing history, location daily reports, and corporate roll-ups.

4.7 Open ecosystem / headless compatibility — Yes, with stated boundaries. The platform is designed to be built on. The Open API is a first-class interface with public, self-service documentation, and Gold's can integrate its own CRM (HubSpot or Salesforce), member app, marketing, analytics, and PT tools without commercial penalty, support degradation, or roadmap de-prioritization. Member-facing journeys such as join and signup, contract self-service, freezes and idle periods, and cancellation are all exposed through the Open API and can run under a fully Gold's-owned UI, with our platform serving as the headless system of record. This pattern is proven in production today. Gold's Gym in Europe already runs its own custom join funnel on our Open API. To be candid about the boundary, administrative configuration, for example creating or modifying membership plans and pricing, is performed in the admin console and is not available through the public API today.

4.8 Product continuity & no forced migration.

Sport Alliance acquired PerfectGym in 2024 and consolidated engineering onto one platform. PerfectGym Next, the product proposed to Gold's, is that platform. It carries our full roadmap and investment, and there are no plans for sunset, merger, or reduced investment. We accept the §15.7 protections contractually. That means no sunset or platform migration without Gold's written consent, advance notice, feature and data parity, vendor-funded migration, and a no-penalty exit with full data return.

Section 5 — Functional Capabilities

Responses to all 287 requirements (§5.1–§5.14) are provided in the accompanying RFI Response Workbook.

Section 6 — Technical, API & Integration

6.1 API Architecture

- **Baseline:** REST APIs over HTTPS, authenticated via a persistent per-studio API key (x-api-key header) with scoped permissions such as MEMBERSHIP_READ and MEMBERSHIP_WRITE. Device-level integrations (card readers, vending) authenticate via OAuth2 Bearer tokens on a separate Device API. There is no GraphQL layer today.
- **Webhooks:** Event-driven notifications for member, membership, and operational events, authenticated via a dedicated outbound API key.
- **Real-time exchange:** External systems such as a member app consume webhooks and call REST endpoints directly; no scheduled batch jobs are needed for operational sync. Data travels as JSON over HTTPS and is updated through standard REST semantics. Because every platform component works on the same data storage, there is no synchronization latency between modules.
- **Latency expectation:** Latency varies by endpoint type rather than following a single fixed figure. Read-heavy endpoints such as customer and studio lookups have a different processing profile than write and transactional endpoints such as signup or payment. As a general benchmark, P95 latency across all endpoints is below 150ms, with individual endpoint latency depending on the complexity of the operation.
- **Sandbox:** A dedicated demo and sandbox tenant is available through the developer portal and remains available for the full duration of the contract.
- **Versioning & rate limits:** Endpoints are versioned under /v1. The default rate limit is 1,000 requests per minute per studio API key rather than per account, so throughput scales with the number of studio keys issued instead of being shared across the whole footprint. Exceeding the limit on a given key returns HTTP 429 for the following minute. Where a use case has a technical need for more throughput, we can raise the limit for that dedicated key.

6.2 Data Ownership & Portability

All member data, custom attributes, and derived outputs belong to Gold's, and we will anchor this contractually (see §4.1). Specific Sport Alliance products, such as PerfectAI, are subject to acceptance of further Terms that specify the rights and ownership of derived outputs.

Full historical data is accessible at any time through the Open API and the documented data warehouse. For a complete bulk extract, at termination or on demand, we work closely with Gold's to define scope and structure, and we deliver the data in a machine-readable format so it can be loaded directly into a successor system or into Gold's own data layer.

Should Gold's ever transition to a successor system, we commit to cooperating directly with that vendor throughout the migration, covering data handover, mapping support, and assistance through cutover, in line with the terms outlined in §15.2.

6.3 Analytics & Data Access (priority area)

- **Data movement.** Two mechanisms are available. Real-time operational access runs through the Open API and webhooks, and analytics-grade data is served through our enterprise data warehouse (Amazon Redshift) with fully documented, stable schemas and a change log. The warehouse is fed through real-time ETL from the operational database and can be queried directly via SQL. Warehouse delivery documentation is published at data-warehouse-docs.perfectgym.com.
- **Analytics: baked-in vs. third-party.** Both. The platform ships operational reporting and dashboards natively, and the documented warehouse is explicitly designed for third-party BI; Power BI and comparable tools connect directly.
- **Visualization & semantic model.** Gold's can operate its own semantic model and viewer on top of the documented warehouse schema; nothing forces use of our visualization layer. Gold's owns the model and the outputs built on it.
- **Interim-then-replace.** Supported and a common pattern. Gold's can start on our Redshift-based warehouse on day one and then feed its own platform (Databricks, Snowflake, or Fabric) as it stands up. The analytics layer is separate from the operational platform, so replacing the consumption layer does not disrupt operations.
- **Unified data layer feed.** Schema documentation exists, and event streams are available via webhooks. There is no direct native integration with data platforms today. The Open API and the data warehouse can both be used to extract data from our platform and feed a Gold's-owned data layer.
- **Data access.** The warehouse schema is fully documented for custom BI. Direct access to the operational database is not offered, since the operational MMS schema changes frequently throughout the day. All data access runs through the Open API and the enterprise data warehouse instead.
- **Data integrity.** The MMS operational database is the single source of truth.

6.4 Required & Existing Integrations

System	How we integrate
CRM (HubSpot / Salesforce)	Bi-directional sync of lead & member data via Open API + webhooks. Middle layer needed for data transfer
Member app (Motion Vibe)	Motion Vibe consumes our REST APIs/webhooks (member status, entitlements, bookings, check-ins) — the standard pattern for customer-owned apps. Alternatively our Branded member platform is available (\$5.10).

System	How we integrate
Gate-control hardware	Native access-control module with real-time entitlement checks at the gate. We maintain a published catalog of supported devices in our help center (Supported hardware for our Platforms), covering access controllers and RFID readers (Gantner, FEIG, PS-Tec, Promag), card and barcode identification devices (Elatec, ACS, HID, Honeywell, Zebra), turnstiles, receipt printers, cash drawers, and vending controllers. Additional hardware partners can be integrated through our Open Device API. Specific hardware of Golds will be assessed during the onboarding process.
Payment processor	Finion Pay (our integrated payment stack, wrapping tier-1 processors) — ACH and card, tokenized storage, dunning, chargeback handling, settlement reporting.
Email / SMS	Native transactional communications plus API-based integration with external providers.
Unified data layer	Documented warehouse + webhook event streams (§6.3).

Ecosystem: The catalog spans corporate fitness and aggregator platforms (Wellhub, myClubs), training equipment and body analysis (EGYM, Seca, TANITA, Inbody), access control (doorsecure DoorAPI), AI assistants (MagicAI Chat, athleo), payments and payment (Finion Pay, collections partners), communication and marketing (business SMS,), class and training experiences (Beat81), member retention (GymDeals), nutrition (SATISFEAT), and e-invoicing for countries with e-Invoicing capabilities. With our Open API we are fully Open to other partners of Golds Gym joining the platform and directly integrating their products. This would remove the necessity for middleware as well.

6.5 Performance Targets

The Open API served ~662 million requests in production over the last 30 days, with an overall p95 response time of 117.7 ms. Check-in traffic (GET `/v1/customers/{customerId}/activities/checkins`) accounted for ~18.6 million of those requests,

responding in the low tens of milliseconds. The signup flow (POST /v1/memberships/signup) carries higher tail latency (p95 ~2 s) because it performs synchronous contract creation and downstream orchestration. This is an expected trait of a write-heavy onboarding transaction, not a performance gap.

At peak, the platform handled ~1,070 requests per second across 10,000+ facilities. Our volume of ~8 billion requests per year sits more than 200x above the 34 million per year target, leaving comfortable headroom for 1,800 concurrent users.

Figures reflect a representative trailing 30-day production window and will vary month to month with seasonal and campaign-driven traffic. We monitor performance continuously and can provide updated or extended-period figures on request.

6.6 Ecosystem Posture (Open vs. Closed)

- **API as primary interface.** Our API strategy follows the customer journey. Use cases that touch the member, such as signup and switching, contract self-service, idle periods, cancellations, add-on modules, offer reads, bookings, and check-ins, are the primary target for API implementation, and we continuously broaden this coverage to support more use cases. We do not steer by a coverage percentage; we prioritize by the value a use case delivers. Administrative configuration is more UI-centric today. The platform is designed for large-scale operations, and some governance and setup processes are better served by a purpose-built UI than by an API. Where Gold's has concrete API needs on the admin side, we are open to extending coverage there as well.
- **Headless / system-of-record mode.** Yes. The member-facing surface can be fully owned by Gold's. Join, account self-service, freeze, cancel, and payment management can run entirely on a Gold's-owned UI calling our APIs, and our UI is not required for members. This model runs in production today. The Gym Group in the UK operates 250 clubs with its own technology team and builds its customer-facing processes on top of our platform.
- **API pricing and metering.** Open API access is included in the SaaS fee. There are no per-call charges or metering tiers. Rate limits exist for technical safety only (see §6.1) and can be raised where a use case requires it.
- **Webhook and event coverage.** The full event catalog is published at developer.sportalliance.com/apis/perfectgym/webhooks. Where Gold's needs events that are not covered yet, we are happy to extend the catalog.
- **Third-party integration policy.** We actively support new partners building on the platform to enable new use cases. Gold's is free to use external third-party tools through the API without limitation, including replacing functions of the core system such as CRM or the branded app. The developer portal is open with self-service API access, and no categories are blocked. BestFitGroup, for example, runs an external CRM connected through a middleware layer as part of building out its internal tech stack.
- **Adjacent-module pricing pressure.** Choosing third-party tools in adjacent categories carries no penalty. Support tier, SLAs, and roadmap priority remain the same regardless of whether Gold's sources adjacent modules from us or from third parties.

- **Customization without professional services.** We aim for a platform that Gold's can administer without vendor interaction. Admin users configure plans, pricing, communication workflows, roles, and reports themselves. We deliberately do not offer a general professional services package; our focus is a stable, reliable product rather than customized development.
- **Vendor use of customer data.** All member data, custom attributes, and derived outputs belong to Gold's, anchored contractually as described in §4.1. Sport Alliance holds usage rights strictly for service delivery, benchmarking, product development, and model training. Specific Sport Alliance products, such as PerfectAI, are subject to acceptance of further Terms that specify the rights and ownership of derived outputs (see §6.2).
- **UI replaceability.** Yes. Gold's can replace the customer-facing UI as it sees fit. Join, account management, billing and payment management, freeze, and cancellation all run through the Open API under a Gold's-owned UI. Back-office administration remains in our UI, as stated in §4.7.
- **Exit.** As described in §4.4, a complete data export is available on demand from the settings area, delivered as a zip archive of XLSX and JSON files including stored documents, with the data warehouse providing the underlying raw data. Migration cooperation is contractually committed, and as the data owner Gold's is entitled to receive its data for any transfer.

6.7 Innovation

Provide your delivered product roadmap for the past 12 months.

- **AI & Automation:** Rolled out the MagicAI Chat - a member assistant across web and branded apps, letting members handle real tasks on their own: booking classes and trial sessions, freezing or cancelling contracts, updating personal data, and resolving contract and billing questions without calling the studio. In parallel, advancing AI-based churn prediction with built-in member consent controls.
- **Open Platform / API:** Public GA of the Developer Portal (v1), multi-brand support, US-region availability; expanded partner sandbox provisioning; broadened Open API coverage (member/contract data, transactions, new webhook events).
- **Payments (Finion Pay / Finion Capital):** Expanded payment infrastructure to new US and APAC regions (Ohio, Melbourne); launched Finion Capital financing product; rebranded to Magicline Payments.
- **Compliance & Localization:** Delivered fiscal/cash-register compliance for Spain (Verifactu, TicketBAI) and Austria; US tax display support; WCAG 2.2 AA accessibility improvements.
- **Core ERP:** Contract/billing engine improvements (payment run scheduling, bulk operations, invoice preview), POS enhancements (multi-member transactions, credit write-offs).
- **Member Experience:** Modernized MySports/Branded Apps UI (design system rollout), added family accounts/booking.

Provide a current product roadmap for the future development of your systems through 2027 with as much detail as possible.

Our roadmap follows a Now/Next/Later (NNL) framework rather than committing to fixed dates for individual features, so we can stay responsive to customer input and market changes without over-promising delivery dates.

- **Now:** features available today or in active rollout (Public/Open/Closed Beta).
- **Next:** prioritized topics in active development, expected within roughly the next 1-2 quarters, without a specific release-date commitment.
- **Later:** topics on our roadmap for the next ~12 months, not yet scheduled for near-term delivery.

This is published and updated quarterly at a public roadmap link, organized by Core ERP, App & B2B2C, Open Platform, and Enterprise themes. The link below contains our newest Q3/2026 roadmap update: <https://roadmap.sportalliance.com/public?t=RoMxh6eW>

Do you provide sandboxes that allow for customer end-to-end regression testing?

Yes. Every customer gets a dedicated sandbox tenant, usable for development, integration testing, and internal end-to-end regression testing. Sandboxes run on the same version as the Production environment.

Are new releases previewed to customers in sandboxes? If so, how much time do you give a customer to perform testing?

No fixed preview window - as a continuously-deployed SaaS platform, we ship updates on a rolling basis and communicate new features to customers as they go live. New features are deactivated by default, so customers control when they turn a feature on and can validate it in their sandbox first.

Do customers have the option to delay updates if there is an issue identified or it adds unnecessary risk to a business event?

No - we run continuous deployment for all customers on the shared platform, so updates ship when ready and aren't delayed on a per-customer basis. This is by design: everyone benefits from fixes, security patches, and improvements immediately. We manage risk through staged rollouts and automated regression testing on our side. Separately, new features are deactivated by default, so customers always control when they start using a given feature, on their own schedule.

Describe how your dev/support and general SDLC processes enable CI/CD and rapid development.

Rapid, incremental delivery is a founding principle of both our development pipeline and our software architecture. We run continuous integration and continuous deployment (CI/CD): every change moves through automated build, test, and regression stages before it reaches production, enabling us to deploy to production several times a day. New functionality ships behind feature flags, deactivated by default, so code can be integrated and released continuously while activation stays under control. This decouples deployment from release and keeps risk low.

We maintain a weekly release cadence internally so that new production code flows out in small, frequent increments at least once a week rather than large, high-risk batches, which keeps the platform stable during active development. Because the pipeline is fully automated and the architecture is service-oriented, we can move fast when it matters: critical fixes can be shipped to production in under two hours from discovery.

This is underpinned by a modern, cloud-native stack (Java backend, React/TypeScript frontend) running on AWS, kept continuously up to date, with automated testing, monitoring, and staged rollouts built into the delivery process. The result is a platform that evolves quickly and safely - fixes, security patches, and improvements reach every customer without waiting on slow release cycles.

Describe how your dev/support and general SDLC processes enable cooperative development with our teams.

We treat client development as a partnership, and our platform is built to be worked with, not just consumed. The primary entry point for cooperative development is our Open API, backed by comprehensive public documentation that serves as the single most important reference for any team building on our interfaces:

<https://developer.sportalliance.com/apis/perfectgym/openapi/general-information>. Because this documentation is public and self-service, your teams can explore, design, and build against our APIs on their own schedule, without gatekeeping.

Alongside the API and its documentation, our Integrations team stands ready to support client teams throughout their implementation. We offer several channels of collaboration depending on what a given phase calls for: joint working sessions to align on design and approach, structured support inquiries for day-to-day questions, and a shared Slack channel for close, real-time cooperation during crunch periods. This lets us flex from lightweight, asynchronous support to hands-on joint delivery as your project demands.

The result is a genuinely collaborative model: your teams retain ownership of their workflows and build at their own pace on well-documented, stable interfaces, while our people stay close enough to unblock, advise, and co-develop when it matters. We see successful integrations as shared outcomes, and we resource them accordingly.

How does your product architecture enable innovation?

PerfectGym Next runs on a scalable cloud platform with a modern, state-of-the-art architecture. Backend and frontend technology (Java backend, React/TypeScript frontend) is kept current to continuously benefit from technological innovation. We invest continuously in our tech stack and leverage the latest AWS infrastructure services. Staying at the forefront of technical development and evolving with the changing technology landscape is a core Sport Alliance principle. Recent AI developments have also been incorporated into our SDLC, infrastructure, and product, and we will continue to innovate with AI technologies to increase platform value for our clients.

Describe your typical development process from feature prioritization to implementation. Include any planning meetings, standups, UAT, QA, etc.

Team plans are set via a quarterly planning cycle. Enterprise customers submit requirements continuously through our Product Development Request (PDR) process, with a cutoff for each quarter's prioritization. Ahead of implementation, we work with a double-diamond approach to first understand the customer problem in depth before converging on a solution that satisfies their needs.

Internally we ship weekly increments into production to keep releases stable during development. Customer-facing releases go out monthly, on the first Wednesday of the month. Once a feature is QA'd and ready, it's assigned to the next monthly release. Our teams follow agile principles company-wide.

What area of your software needs the most improvement or is missing?

Lead processing and CRM is one area. Our native capabilities are limited, so we've extended the Open API that clients can run their CRM of choice (e.g. HubSpot) instead, while continuing to invest in AI features and partner connectivity.

Analytics is the other: the native module works well for a high-level view on club performance but isn't built for enterprise reporting needs. It lacks a native report builder, so enterprise clients today typically work off our DWH for raw-data access. We're currently in the process of rebuilding our Analytics area from scratch, with a native report builder as one of the core deliverables to solve one of our customer's major painpoints.

Do you currently offer customer specific customizations? If so, provide examples.

We don't build customer-specific customizations or maintain separate forks/versions. Every customer, from the smallest single-location gym to the largest global enterprise chain, runs on the same shared platform, on the same version. Enterprise input shapes our roadmap (e.g. via the PDR process), but what gets built becomes part of the core product for everyone, not a bespoke branch for one customer.

Provide a sample of your product requirements definition document (story, epic, etc.).

We can't share internal PRD/epic documentation, but we've attached our Development Request Form. This is the structured intake document enterprise clients like Gold's Gym would use to submit feature requests through our PDR process. See Appendix

[SPA - Development Request Form](#)

Section 7 — Franchise & Multi-Tenant Architecture

7.1 Centralized Data, Decentralized Execution

Corporate operates at brand level with full network visibility and cross-location reporting, while each franchisee's staff sees and manages only their own locations through role-based and location-scoped permissions. Member data is centralized, so one member has one profile across the entire network. Member-facing channels are configured at brand level, and no vendor-to-franchisee consumer app bypasses brand-controlled surfaces.

7.2 Configuration Hierarchy

The platform distinguishes brand-level configuration, enforced by corporate, from location-level settings managed by the individual club. This is exactly the "brand level controls" model referenced in §3.3. Our whitelisting mechanism and permission-based access to clubs give Gold's the configuration tools to build out a franchisor-led ecosystem throughout the network, with corporate deciding what is mandatory across the brand and what remains open for local adaptation.

7.3 Scale & Onboarding

Our implementation methodology is wave-based and proven at scale. Each rollout moves through preparation and discovery, migration and configuration in a secure staging environment, one or more pilot locations, controlled rollout batches, and a hypercare phase. Once a wave is validated, multiple locations per day are feasible. The Sport Alliance Migration Platform has executed more than 8,000 migrations. Our largest comparable deployments are RSG Group (McFit, John Reed, and Gold's Gym Europe, a relationship spanning seven years and several hundred locations) and L'Orange Bleue (see case study below).

7.4 Brand Standard Enforcement

Brand standards are enforced structurally (corporate-owned product catalog, document templates, communication templates, access rules) while franchisees retain autonomy in local operations within those rails — adherence by architecture rather than by policing.

Section 8 — Security, Compliance & Data Privacy

Cloud Infrastructure & High Availability

Sport Alliance's core SaaS platforms run exclusively on AWS. Production environments are architected across three Availability Zones within the primary region, with automated load balancing and failover (RTO under 30 minutes, RPO under 1 minute). For regional-scale resilience, critical data is replicated to a secondary, geographically distinct AWS region, including continuous S3 replication and automated RDS backups.

Data Encryption

All data in transit is secured via TLS 1.2 or higher; older protocols (SSL, TLS 1.1) are disabled. Data at rest is encrypted using AES-256, with mandatory key rotation and access governed by MFA and role-based controls.

Data Privacy & GDPR

As an EU-headquartered organization, operations are GDPR-compliant. Privacy-by-design is enforced through mandatory DPIAs prior to any new project or processing change posing elevated risk to individuals' rights. Third parties processing personal data on Sport Alliance's behalf must sign a DPA and pass a security risk assessment.

Identity & Access Management

Access follows least-privilege and need-to-know principles via Role-Based Access Control, with permissions defined in a standardized table approved by department heads and risk managers, including application-level segregation between different operational roles and entities. Human access to company systems is governed through Okta, with MFA enforced for critical systems, remote access, and cloud applications.

Payment Card Security & PCI-DSS

Finion Pay, our integrated payment stack, is built as a layer on top of Adyen for Platforms and leverages Adyen's PCI-DSS compliance and security mechanisms. Clear-text payment data never touches our systems; card data is captured and tokenized inside the processor's PCI-certified boundary. For member-facing journeys, we deliver a secure universal payment component that integrates into join flows and other customer-facing payment flows, so sensitive payment data is handled by the certified component end to end.

Section 9 — Service Levels

Our SLA runs on two parallel tracks. Understanding this split is essential for reading the severity comparison below, because outage recovery does not depend on Gold's raising a ticket.

Technical Support (automated detection, engineer-led recovery, active 24/7). Automatic system monitoring checks every service, the network, and all infrastructure components every 60 seconds, around the clock. On detection of a malfunction, our on-call Technical Support team is alerted and responds within 5 minutes during business hours and within 20 minutes outside business hours, independent of any customer action. This is the track that resolves outages, and it runs every day of the year.

Global Enterprise Support (customer care). A dedicated support channel for Gold's within our ticket system, reachable on weekdays from 8:00 am to 8:00 pm EST/EDT, free of charge. This track governs customer-raised requests, where our care team helps Gold's diagnose issues and answers questions. It is the assistance path, not the path by which we recover from downtime events.

9.1 Uptime. We commit to 99.95% system availability on a monthly average, measured around the clock and excluding announced maintenance windows. This exceeds Gold's 99.9% target.

9.2 Response and resolution by severity. Customer-raised requests are classified into four priorities with committed response times. Priority 1 (Urgent) receives a response within 1 business hour, Priority 2 (High) within 8 business hours, Priority 3 (Medium) within 24 business hours, and Priority 4 (Low) within 96 business hours, with business hours running weekdays 8:00 am to 8:00 pm EST/EDT. Measured against Gold's expectations, Critical is met through the 1-business-hour response combined with the monitoring-driven Technical Support track, which acts within 5 to 20 minutes on any system-down event, 24/7. To be candid on the remaining tiers, our customer-care windows for High and Medium are formally wider than Gold's stated 4-hour and 1-business-day expectations. In practice, malfunctions with significant operational impact are detected by monitoring and handled on the Technical Support track without waiting for a ticket.

9.3 Maintenance windows. Planned maintenance is announced at least 24 hours in advance on the status page and generally takes place off-peak between 10:00 pm and 5:00 am EST/EDT. Unscheduled maintenance is the exception and occurs only where delay would create greater risk than the disruption itself, for example urgent security fixes.

9.4 Disaster recovery. Recovery objectives are tiered to the scope of disruption. Local failures (Tier 1) are covered by multi-AZ automated failover across three physical data centers within the primary AWS region, with an RTO below 30 minutes and an RPO below 1 minute through synchronous or near-synchronous replication. Regional failures (Tier 2) are covered by a

cross-region recovery strategy with an RTO of 36 hours to stand up service in a secondary geographic region and an RPO below 24 hours. Backups are continuous and incremental, and customer data is stored redundantly. Object storage (AWS S3, used exclusively for document storage) replicates continuously, and databases (AWS RDS, used exclusively for transactional records and textual content) are backed up frequently and automatically. Infrastructure-as-code capabilities allow us to provision a new production environment in the secondary region and restore from secure backups in the event of a full regional disaster.

9.5 Service credits. Credits are defined in the SLA and scale with the size of the miss. If monthly availability falls below 99.95%, Gold's is entitled to a flat reduction of 3% of the monthly net remuneration per affected studio, rising to 6% below 99.90%. Missed customer-care response times accrue separate credits per priority level, each capped at 10% of monthly net remuneration. Below 93% availability, additional compensation applies beyond the flat credits. The full mechanics, including measurement and claim windows, are set out in the attached SLA. Standard SLA support is included in per-location pricing; there is no separate support-tier fee.

Section 10 — Implementation, Migration & Change Management

10.1 Phased rollout. We propose: preparation & discovery → configuration + migration rehearsal in staging → pilot location(s) with incumbent running in parallel → regional waves in controlled batches → full network, each wave verified stable before the next. Because data is copied, not moved, the incumbent remains a live fallback during each wave.

10.2 Vendor-led data migration. The Sport Alliance Migration Platform (8,000+ migrations executed) automates extraction, transformation, and validation in a secure staging environment: member master, transaction and billing history, payment tokens (via processor-supported token migration), freezes/pauses with dates, custom attributes, and historical reporting data. Automated quality checks plus customer UAT before go-live; documented rollback plan; Gold's validates, we execute.

10.3 Training & change management. Train-the-trainer model with role-specific tracks (front desk, PT staff, club manager, franchisee owner, corporate analyst), delivered by our onboarding consultants with supporting materials and post-go-live hypercare sessions.

10.4 Franchisee adoption playbook. We support Gold's-led change management with pilot evidence, role-based enablement, and hypercare per wave. Case studies from a comparable franchise networks:

L'Orange Bleue (LOB – France & Spain)

Scope: ~400 Clubs | ~400,000 Members

1. The Challenge: Decentralized Franchise Complexity

Before the partnership with Sport Alliance, L'Orange Bleue faced the typical hurdles of a large-scale franchise operation:

- **System Heterogeneity:**
A fragmented landscape of local software solutions across 400 locations made central management impossible.
- **Lack of Central Governance:**
The HQ had limited real-time visibility into the performance and financial data of individual franchise partners.
- **Market Entry Barriers:**
Entering new markets like Spain required a platform that could handle different languages, tax laws (fiscalization), and payment methods simultaneously.

2. The Solution: A Unified, Multi-Entity Architecture

Sport Alliance implemented Magicline as the central operating system, specifically tailored to the needs of a large-scale franchisor:

- **Franchise-Ready Infrastructure:**
A cloud-based architecture that provides the perfect balance between central HQ control (global configurations/reporting) and local franchisee autonomy.
- **Localized Compliance:**
Full integration of French fiscalization requirements (NF525/e-invoicing) and Spanish payment standards, ensuring legal compliance across borders.
- **International API Ecosystem:**
Seamless connection of local access control systems and payment providers through our robust API, creating a "localized" experience on a "global" platform.

3. The Implementation: Scalable Rollout Playbook

The migration of LOB was a masterclass in handling volume without disrupting the daily business of hundreds of independent business owners:

- **Structured Batch Rollout:**
Following a successful pilot phase, the ~400 clubs were migrated in structured waves using a standardized "Rollout Playbook."
- **Proven Data Migration:**
Successfully transferred a massive volume of member contracts and payment data from various legacy providers into the Sport Alliance ecosystem.
- **Future-Proofing:**
Beyond the initial migration, the system was built to support the expansion of an additional 40 clubs planned for 2026.

4. Key Results & Impact

- **Centralized Oversight:**
LOB HQ now has a "Single Source of Truth," allowing for real-time reporting and data-driven decision-making across the entire network.
- **Operational Efficiency:**
Automation of membership management and billing processes has significantly reduced the administrative burden for individual franchisees.
- **Market Leadership:**
By modernizing their tech stack, LOB has solidified its position as the leading fitness franchise in France and successfully established its footprint in Spain.

Why this is relevant for you:

The L'Orange Bleue project serves as the **"Blueprint for Franchise & International Success."** While your club expansion requires high stability, our experience with a 400-club network ensures:

- **We master "Massive-Scale" complexity:** We have already proven that our platform can handle much larger volumes than your current expansion target.
- **Zero-Risk Migration:** Our battle-tested migration processes minimize the operational risk for your club managers.
- **International Readiness:** Whether you expand locally or across borders, our platform is already equipped with the necessary fiscal and linguistic localizations.

"The migration of our network to Sport Alliance was a strategic milestone that finally gave us the transparency and scalability we needed to lead the French market and expand into Europe." > — José Nercellas, CEO of L'Orange bleue

10.5 Project staffing & RACI. Standard team: Project Manager (governance, continuity through go-live), Onboarding Consultant(s), Data Migration Engineer, Customer Success Manager for post-stabilization, with a defined escalation path. Named individuals cannot be shared at this point in time, but we will make sure to dedicated senior people to support the overall project. A dedicated RACI matrix can be supplied during the project phase.

Section 11 — Commercial Posture (narrative)

Our commercial posture is built on three core pillars: **simplicity, transparency, and strategic alignment** with Gold's Gym's long-term growth. We believe an enterprise software partnership should eliminate financial unpredictability and foster mutual commercial success.

1. Core Platform Subscription & Lifetime Updates

The PerfectGym Next core platform is offered via a predictable per-location subscription fee.

- **All-Inclusive PG Next Core:**
This fee grants comprehensive access to the core platform, including standard APIs and webhooks, eliminating hidden connectivity or integration costs across your network.
- **Continuous Innovation Included:**
All standard platform updates, maintenance releases, and core feature enhancements are fully included in the subscription fee. Gold's will always run on our latest technology without facing hidden upgrade or licensing costs down the road.
- **Enterprise-Grade Support:**
SLA-backed support is fully embedded within the core subscription. We do not gatekeep critical reliability behind premium support tiers—enterprise support is our standard for all locations.

2. Ecosystem Payments & Modular Expansion

Beyond the core platform, our architecture supports a modular ecosystem designed to scale with your business priorities. We divide these advanced capabilities into two categories:

- **Integrated Core Operations (Finion Pay):**
Payment operations are powered natively via Finion Pay. To ensure seamless financial automation and reduce franchise churn, this native payment infrastructure is an integral, non-separable component of our deployment, operating on a competitive, per-transaction blended-rate model.
- **Optional Enterprise Modules:**
To future-proof your business without inflating your baseline costs, Gold's can optionally activate next-generation product groups outside the core platform as needed. This includes advanced capabilities such as AI-driven functionalities for member retention and our comprehensive Enterprise Data Warehouse for advanced business intelligence.

3. Long-Term Predictability & TCO Commitment

To demonstrate our commitment to absolute financial transparency, Sport Alliance will provide a, A-to-Z 5-year TCO model during this RFP round. This comprehensive model ensures Gold's can forecast its long-term financial commitments with 100% certainty, with nothing omitted.

4. Commercial Flexibility & Agility

We understand the scale of Gold's franchise operations requires commercial agility. We are prepared to discuss flexibility across key levers to support your business case, specifically regarding scaled volume tiers for core subscription pricing, implementation incentives based on rollout velocity across corporate and franchise sites, and transactional rate optimization aligned with network processing volumes.

Section 12 — Vendor Qualifications & References

12.1 Company background. Sport Alliance brings more than 14 years of fitness-industry-specific expertise. The group is headquartered in Hamburg, with the U.S. subsidiary Sport Alliance LLC in Boston and hubs in Warsaw, London, and Melbourne, employing ~400 FTE across 36 nationalities, backed by PSG Equity. Our platform runs 12,000+ facilities in more than 30 countries, including 130+ international chains and 14 of Europe's 30 largest operators, and holds market leadership in the Australian leisure segment.

12.2 Comparable deployments. Multi-location franchise fitness at scale is our core segment. Reference deployments include RSG Group (McFit, John Reed, and Gold's Gym in Europe, a 7-year relationship), clever fit (a franchise network of more than 500 clubs), Life Fit Group (Fitness First Germany and Elbgym, more than 200 clubs), Urban Gym Group (multi-country, multi-brand, more than 30 clubs), and many others.

12.3 References. Besides Gold's Gym Europe, who are already actively using our platform for their operations, we are happy to supply references at proposal stage.

12.4 Implementation team. Named individuals cannot be shared at this point in time, but we will make sure to dedicate senior people to support the overall project.

12.5 Product roadmap. We do not maintain a fixed 12-month feature roadmap. Instead we publish a Now/Next/Later (NNL) roadmap, updated quarterly at a public link and organized by Core ERP, App & B2B2C, Open Platform, and Enterprise themes (see §6.7 for the framework and the link). This keeps us responsive to customer input and market changes without over-promising delivery dates. Customer feedback drives prioritization through our formal Product Development Request (PDR) process, which gives enterprise customers committed quarterly development capacity; Gold's would participate directly. Current investment areas include AI (the MagicAI member assistant and churn prediction) and Open Platform/API expansion, alongside continued modernization of our member-facing apps. Our ecosystem strategy is straightforward. We are building a platform customers extend with their own tools and UIs, not a suite customers must adopt end-to-end. The Open API, documented data warehouse,

and headless member journeys exist precisely for the assembled-platform model Gold's describes.

12.6 Product Continuity & Sunset Disclosure.

Sunset disclosure. PerfectGym Next, the product proposed to Gold's, has no plan, evaluation, or risk of sunset, end-of-life, deprecation, or reduced investment within the next 12 months. Status: no current plan. It carries our full roadmap and investment. One item we disclose plainly: the legacy PerfectGym platform, which came with the 2024 acquisition, is on a committed convergence path onto PerfectGym Next (see next point).

Platform consolidation / forced migration. Sport Alliance acquired PerfectGym in 2024 and consolidated engineering onto one platform. PerfectGym Next is that platform. Existing customers of the legacy PerfectGym product are being offered migration to PerfectGym Next. Gold's would contract on PerfectGym Next directly, the target of that consolidation, not a platform being wound down.

History. Within the last 36 months, the relevant event is the consolidation described above. The customers of the legacy PerfectGym platform do not face a forced migration and we keep supporting the legacy platform.

The product we'd be buying. PerfectGym Next is the strategic go-forward platform for enterprise and international customers and the platform Sport Alliance invests in long-term. It is not on a convergence path onto any other product; it is the convergence target. There are no plans for sunset, merger, or reduced investment.

Accountability. We stand behind these answers contractually and accept the §15.7 protections. That means no sunset or platform migration without Gold's written consent, advance notice, feature and data parity, vendor-funded migration, and a no-penalty exit with full data return.

Appendix C — Foundational Requirements Summary

#	Requirement	Yes / Partial / No	Notes
4.1	Full data ownership (contractual)	Yes	Contractual commitment as stated in 6.2
4.2	Real-time API access (REST + webhooks)	Yes	developer.sportalliance.com
4.3	Multi-location franchise architecture (native)	Yes	Built multi-facility-first; runs Europe's largest franchises

#	Requirement	Yes / Partial / No	Notes
4.4	Documented data export & migration	Yes	See 4.4
4.5	U.S. market support	Yes	Sport Alliance LLC, Boston HQ with US staff onsite
4.6	POS / retail integrated	Yes	Native POS, one member account of truth
4.7	Open ecosystem / headless	Partial→Yes	Member journeys fully headless via API; admin plan/pricing configuration is UI-only today
4.8	Product continuity & no forced migration	Yes	PG Next is the go-forward platform; formal disclosure per 12.6
