

REQUEST FOR PROPOSAL

Mobile Application

Digital Ecosystem Transformation – Armah Sports Company

ARMAH CORPORATE PROFILE

Armah Sports Company is a leading Saudi joint-stock company listed on the Nomu – Parallel Market. Established in 2019, Armah is a pioneer in the Saudi fitness industry, aiming to transform the Kingdom into a global leader in health and innovation in line with Saudi Vision 2030.

- **Brands:** Armah operates the luxury **Optimo** brand and the premium "smart tech" **B_FIT** clubs.
- **Scale:** 15 facilities across Riyadh and Jeddah. The system selected through this RFP must support an expansion roadmap to 50 clubs by 2030.
- **Leadership:** Led by the Alhagbani family, the management team brings over 150 years of collective experience in the Saudi fitness sector.
- **Tech-First Strategy:** Armah's "Smart Club" model integrates seamlessly with external platforms and operates in a paperless environment.

QODECA CORPORATE PROFILE

Founded in 2015 and headquartered in Poland, Qodeca is an IT technology and advisory firm specializing in the fitness, sports, and healthcare sectors. The team acts as a long-term strategic partner, guiding clients from initial strategy through to global scaling. With over 10 years of domain-specific experience, Qodeca has successfully delivered more than 80 projects for 53 global clients, including PureGym Arabia (KSA), Solinca, and EoS Fitness. Qodeca provides deep technical expertise in digital ecosystem audits, product requirement definition and implementation governance.

CONTEXT: this RFP within the Armah digital ecosystem

This RFP concerns the member-facing mobile application only. It is one stream of a wider Armah digital transformation that also covers the Gym Management System (GMS) and the website with a web client portal, each procured separately. Two facts shape every requirement and must be understood before responding:

- **Existing members only:** The application serves members who already hold a contract in the GMS. Initial membership acquisition happens in-club and in the web portal, not in the app. The app does not sell first memberships.
- **The GMS is the primary upstream system:** For the business and data layer — member identity, contracts, plan catalogue and pricing, bookings, access-rule evaluation, wallet, and ZATCA invoice issuance — the GMS is the system of record and the app consumes it via API rather than

Qodeca sp. z o.o.

re-implementing it. The GMS also owns the access / check-in hardware integrations (gates, Pocket Key, Gantner) and ZATCA document issuance. Beyond that layer, the app integrates directly with several external services (payment gateway, BNPL providers, body-composition devices, push, wallet passes, social login, health platforms). Every requirement's Upstream Dependency column states whether it is GMS-mediated, a direct External integration, or a combination.

This document is issued to custom-build vendors. Armah is procuring the member mobile application as a bespoke build and assesses each proposal on how the vendor will design, build, and deliver against the requirements, and on the effort and cost basis of that build. A vendor that prices this app as re-implementing the GMS-owned business layer (commerce, contracts, billing, invoice issuance) will misread the scope and over-bid; the app consumes that layer from the GMS while integrating directly with the external services in §3.2.

1. Instructions for Vendor response

Armah Sports Company will not evaluate vague or generic proposals. To be considered, vendors must adhere to the following.

1.1 Functional Matrix - mandatory completion

The accompanying Functional Matrix (Excel) is the primary response artefact. Every requirement row across every tab MUST be completed. Against each requirement the vendor MUST provide:

- **Approach:** select one of: Standard build, Complex build, Third-party integration, Not recommended. States how the requirement will be delivered and signals where cost and risk concentrate.
- **Vendor Statement & Answers:** how the capability will be built, the architecture, and the GMS API / webhook contract it assumes (endpoints consumed, events subscribed).
- **Effort (days):** mandatory on every row. The basis of the estimate; the day-rate is stated in the commercial summary, not per row.
- **Assumptions / clarifications:** any assumption the answer depends on, or an open question the vendor needs Armah to confirm.

1.2 Descriptive responses only

"Yes", "No", or "Standard" are not acceptable answers. For each requirement, a detailed proposal on how the build fulfils the function MUST be provided, including where applicable:

- the workflow logic and the member-facing experience;
- the build approach and any third-party components relied on;
- the GMS API / webhook contract the capability depends on (what the app reads from and writes to the GMS, and which GMS events it reacts to);
- visual or technical proof (wireframes or architectural diagrams in the appendix).

1.3 Alternative approaches are welcome

Where a vendor proposes to meet a requirement differently or better than the matrix wording, the vendor is encouraged to describe the alternative in the Vendor Statement, recording it under Assumptions /

Qodeca sp. z o.o.

clarifications. Armah evaluates alternatives on the goal of the requirement, not the literal wording. This is especially relevant for engagement, loyalty, AI recommendations, and personal-training interaction patterns.

1.4 Additional capability

If the application provides additional functionality per domain beyond what is specified, vendors MUST describe these capabilities with use-case explanations by delivering supporting specification documents.

1.5 Additional documents required

In addition to the Functional Matrix, vendors must submit:

- **Company profile:** corporate overview, ownership, headcount, geographic presence, and fitness-sector track record.
- **Customer references / case studies:** from at least three production custom-build deliveries (multi-brand, gender-segregated, or KSA / GCC environments preferred).
- **Executive offer presentation:** a slide deck (max 20 slides) summarising the proposed solution, delivery approach, team, and commercial highlights, suitable for review by Armah executive management.
- **Additional commercial materials (optional):** any supplementary pricing breakdown, rate card, or alternative commercial model the vendor wishes to provide alongside the matrix response.

1.6 Submission process and Q&A protocol

Evaluation framework: Responses are evaluated holistically against functional fit (Functional Matrix), technical and non-functional fit, commercial competitiveness, delivery approach and team, and production track record. Specific weightings are confidential to Armah Sports. Vendors must provide thorough, evidence-backed answers across all tabs and sections; no tab or section may be assumed lower-priority.

Submission method: Responses MAY be submitted by email to the primary contact (below) or via a shared Drive folder agreed with the primary contact.

Submission contents: The completed Functional Matrix (Excel); including per-requirement effort in the Effort (days) column; the commercial response in the Solution Approach & Commercial tab (Pricing); the narrative covering the Solution Approach & Commercial and Transition & Migration sections; the executive presentation (max 20 slides); the company profile and references; reference-customer contact details; and any supporting appendices (wireframes, architectural diagrams, sample API payloads, sample integration contracts, and optional commercial materials).

Primary contact: All written communication regarding this RFP MUST be addressed to Qodeca, Armah Sports' technical advisor managing the RFP process: Paulina Rieux, RFP Programme Lead (paulina.rioux@qodeca.com) and Anna Świdarska, Project Manager (anna.swiderska@qodeca.com).

Confidentiality: This document and the Functional Matrix are confidential and shall not be shared, disclosed, or reproduced outside the vendor's response team without written permission from Armah Sports.

Qodeca sp. z o.o.

2. Functional Requirements Summary

The sub-sections below are a high-level overview of the functional domains. Detailed requirements, priorities, and upstream dependencies for each point are defined in the accompanying Functional Matrix, which is the authoritative artefact. The application scope is the member experience for existing B_FIT and Optimo members; capabilities are delivered by the app and powered by the GMS unless otherwise tagged.

2.1. Authentication & session

- Login by email or mobile with password; one active session per member with sign-out of the previous device.
- App access gated on an active GMS membership contract; one-time OTP at first activation; device biometric login.
- Unified identity across B_FIT and Optimo with brand-specific entitlements; full session lifecycle (issue, refresh, expire, revoke); brute-force protection and account recovery.
- Social login (Sign in with Apple / Google) offered as a priced option.

2.2. Member Profile

- View / edit of non-sensitive fields with immediate effect; sensitive fields read-only with GMS-side approval; contact-change re-verification by OTP.
- GMS-defined member-photo display policy applied per member (female-photo zero-display at launch, GMS-controlled toggle reserved for the future).
- Document Vault (Iqama, medical clearance, agreements, PAR-Q output); activity ledger; settings hub; fitness goals and manual body-measurement logging.
- Digital membership card with Apple Wallet / Google Wallet pass; always-accessible legal documents; self-service account closure; optional gamified profile-completion and smart onboarding.

2.3. Commerce (existing-member transactions)

- Plan catalogue for additional and renewal purchases with brand-aware filtering and live GMS pricing, mirroring member-portal capability; in-app purchase of renewals and mid-membership add-ons.
- Active membership view; member-initiated freeze, upgrade with pro-rata, and membership transfer (GMS contract shift); promo-code validation; feature availability reflecting membership tier.
- Cancellation and refund handling per KSA cooling-off and club business rules, with a refund-eligibility pre-check and approval-matrix flow; order history with downloadable ZATCA receipts.
- Offers centre, auto-renewal transparency, F&B / retail pre-order, and guest-pass request as priced options.

2.4. Booking

- Master schedule across all bookable resources (classes, PT, courts, pool, spa, equipment) with real-time capacity, concurrency, and conflict validation; resource hold during checkout.

Qodeca sp. z o.o.

- Booking, modification, and cancellation per the GMS resource-type policy, surfacing GMS-defined outcomes (strikes, refunds, fees); strike-count and booking-limit display.
- PT booking with package consumption; waitlist with FIFO auto-promotion; reminders and change notifications; recurring bookings, post-attendance rating, and calendar sync as priced options.

2.5. Access & club operations

- Dynamic QR access credential at launch; NFC and BLE pocket-key credentials as priced options; offline check-in with cached credentials.
- GMS-issued gate-denial reasons surfaced with member guidance; check-out flow; secondary-zone check-in.
- Real-time facility and zone occupancy, historical traffic patterns, interactive facility map, and geolocation nearest-club sort.

2.6. Payments, wallet & ZATCA

- Member wallet with stored-value balance and transaction history; tokenised stored payment methods (view / add / remove / set default); mixed-tender (wallet plus card).
- HyperPay gateway with KSA-relevant methods (mada, Apple Pay, Samsung Pay, Google Pay); native BNPL across Tabby, Tamara, Medfloor, and MISPay.
- Display and download of GMS-issued ZATCA Phase 2 e-invoices and ZATCA-compliant credit notes for app-initiated transactions and refunds; payment-failure handling and configurable wallet top-up.

2.7. Fitness content & workouts

- Workout logging (sets, reps, weight, duration, RPE) with history, personal records, and progression charts; exercise library with demonstrations and muscle-group taxonomy; custom workout builder shareable with a PT.
- Adaptive AI workout generation, captioned video / mindfulness library, nutrition tracking, and live streaming as priced options.

2.8. Engagement, community & loyalty

- Push notifications (APNs / FCM) and in-app inbox for trainer-member messaging; per-category, per-channel preferences with PDPL consent receipt.
- Streaks, achievements, challenges with leaderboards, community groups, and a moderated activity feed; birthday / anniversary triggers; in-app surveys and NPS; member referral programme.
- Vendor-proposed personal-trainer interaction architecture (secure messaging, programme assignment, completion tracking, PT add-on payment routing), each capability priced separately.
- Loyalty tier mechanics and a personalised AI recommendations engine as priced options, with the engine's build model (in-house / OOTB / third-party) and ongoing inference cost disclosed.

2.9. Branding & localisation

- Bilingual Arabic / English UI with full RTL rendering and mixed-content handling without layout breakage; Hijri and Gregorian dates; SAR at launch.

Qodeca sp. z o.o.

- Brand-aware theming for B_FIT and Optimo from a shared codebase; architecture allowing new languages by configuration without core re-engineering.

2.10. Support

- In-app help and FAQ; live chat (member to club / CX); ticket / request submission with status visibility.

3. Technical & Integration Architecture

This section states the integration and non-functional expectations. Endpoint-level and payload-level detail must be provided in the Functional Matrix and appendices. The governing principle is that the GMS is the system of record for the business and data layer, while the app also integrates directly with a defined set of external services. Each requirement's Upstream Dependency column is authoritative for which applies.

3.1 Integration model: GMS plus direct external services

- **GMS as system of record (business & data layer)** — member identity, contracts, plan catalogue and pricing, bookings, access-rule evaluation, wallet, and ZATCA invoice issuance live in the GMS. For these the app reads and writes through GMS APIs and reacts to GMS events; it does not maintain a parallel source of truth. The GMS also owns the access / check-in hardware integrations.
- **Direct external integrations** — separately, the app integrates directly with the external services listed in §3.2 (payment gateway, BNPL, body-composition devices, push, wallet passes, social login, health platforms). These are not GMS-mediated; the vendor owns and prices them.
- **API expectations** — the vendor states the API patterns the app relies on (REST / GraphQL, webhooks, event streams), authentication model, pagination, rate limits, and how the app behaves when the GMS is briefly unavailable.
- **GMS-not-yet-selected assumption** — the GMS vendor is being procured in parallel and is not yet selected. For pricing, vendors MUST assume a modern GMS exposing member, contract, plan-catalogue, booking, access, wallet, payment-state, and ZATCA-document APIs over REST / webhooks, and MUST separately state a per-integration cost or day-rate to adapt to the GMS actually selected. Vendors should list any GMS platforms they already integrate with in production.

3.2 Directly-integrated external services

The following are integrated by the app directly (tagged External in the matrix). Vendors MUST address each, stating responsibility, reuse vs. rebuild of any existing integration, and cost / timeline:

Service	Purpose in the app	Responsibility
HyperPay gateway	In-app payment with mada, Visa, Mastercard,	Mobile vendor

Qodeca sp. z o.o.

	Apple Pay, Samsung Pay, Google Pay; tokenised card management.	
BNPL — Tabby, Tamara, Medfloor, MISPay	Native in-checkout BNPL with asynchronous-callback handling.	Mobile vendor
Apple / Google OAuth	Social login (priced option); Apple Sign-In mandatory if any social login is offered.	Mobile vendor
APNs / FCM	Push notification delivery.	Mobile vendor
Apple HealthKit / Google Health Connect	Health and activity data sync (where in scope).	Mobile vendor
InBody / body-composition devices	Direct retrieval and display of member body-composition results in the app.	Mobile vendor
Apple Wallet / Google Wallet	Digital membership card / pass issuance.	Mobile vendor

Systems that remain GMS-owned and are consumed via the GMS rather than integrated directly by the app: ZATCA e-invoicing, access / check-in hardware (gates, Pocket Key, Gantner), messaging (SMS / WhatsApp), CRM, and POS.

4. Non-functional Requirements

4.1 Non-functional requirements (summary)

Detailed NFR targets are in the NFR tab of the Functional Matrix. Headline expectations:

- **Availability & performance** — vendor-committed app and back-office availability target; responsive critical interactions; stated cold-start time, crash-free-session rate, and app-size budget.
- **Offline resilience** — check-in / access credential available offline via cached credentials when the network is briefly unavailable; vendor states offline scope beyond check-in.
- **Security** — OWASP MASVS conformance level stated; secure credential storage; biometric unlock; certificate pinning; vendor-run penetration testing with a stated remediation SLA. Tagged Mobile vendor.

Qodeca sp. z o.o.

- **Scalability** — sized for the expansion to 50 clubs by 2030 and projected member volume, with headroom and no core re-architecture.
- **Data residency & hosting** — KSA-resident hosting preferred but not required at launch; if hosted outside KSA, the vendor demonstrates PDPL compliance, PDPL-compliant cross-border transfer safeguards, encryption at rest and in transit, breach-notification SLAs, and a path to KSA-resident hosting if regulations tighten.

4.2 Localisation & compliance (KSA)

- **Localisation** — Arabic / English with dynamic switching, full RTL, mixed-content without layout breakage; Hijri and Gregorian dates; SAR at launch; new languages by configuration.
- **PDPL** — per-category, per-channel consent with consent receipt; data treatment compliant with Saudi PDPL.
- **Female-photo zero-display** — the app enforces the GMS-defined member-photo display policy; female-photo zero-display at launch.
- **ZATCA** — the app displays and lets members download GMS-issued ZATCA Phase 2 e-invoices and credit notes; it does not itself issue or stamp invoices.
- **Data ownership** — Armah owns 100% of member data; export available without hidden fees.

5. Solution approach & commercial

Vendors must address each of the following in the Solution Approach & Commercial section of their response.

5.1 Delivery approach

- **Tech stack & architecture:** proposed native iOS / Android, cross-platform, or hybrid stack with rationale weighing performance and 3–5 year future-proofing; backend architecture, deployment topology, hosting region(s), and the API patterns used toward the GMS and the external services in §3.2.
- **Hosting & operations model:** whether the backend is Armah-hosted, vendor-hosted, or a managed-service hybrid, with the operational responsibilities and trade-offs of each.
- **Team composition & location:** the proposed team (PM, designers, mobile and backend developers, QA, DevOps), onshore / nearshore / offshore mix, and working language.
- **Delivery method & sign-off:** methodology, and how requirements are validated and signed off through build, including go-live acceptance categories.
- **Implementation timeline & phases:** discovery, design, build, UAT, store submission, phased rollout, and stabilisation, with the MVP / V1 / V2 horizon and the prioritisation framework used to sequence features.

Qodeca sp. z o.o.

- Multi-brand model: how two brands (B_FIT, Optimo) are delivered — single app with brand switching, separate apps on a shared codebase / backend, or other — with the cross-brand member experience and the build / maintenance / cost impact of the chosen model.
- KSA readiness: how Arabic RTL, Hijri calendar, mada / Apple Pay / Samsung Pay / Google Pay, the BNPL providers, ZATCA receipt rendering, and female-photo zero-display are delivered; prior KSA-market apps delivered, with references where available.
- GMS integration: the approach, effort, and timeline to integrate the GMS once selected (per §3.1), and any GMS platforms already integrated in production.

5.2 IP, support & security

- IP & source code: ownership of the source code, design assets, and IP at delivery (with third-party-library licences and any exceptions stated), and Armah's rights to maintain or transfer the codebase.
- Post-launch evolution & warranty: how new features are scoped, estimated, and delivered after go-live; warranty period; defect-fix SLA per severity tier; retainer model and ad-hoc time-and-materials rates.
- SLA & support: SLA framework (uptime, severity tiers S1–S4 with response / resolution targets, service credits); support model and channels; penetration-testing cadence and remediation SLA; cyber-insurance coverage.
- Knowledge transfer: artefacts produced (code and API documentation, deployment runbooks, on-call playbooks) and the enablement model for Armah's internal team.
- App store account ownership: publishing-account strategy (vendor-owned vs Armah-owned Apple Developer Programme and Google Play Console accounts), certificate / key management, and the CI/CD signing approach.
- Subcontractors: disclosure of any subcontractors involved in the build (offshore dev partner, design house, specialist consultants) and their scope.

5.3. Commercial response

The commercial response is captured in the Pricing row of the Solution Approach & Commercial tab, supported by the per-requirement effort recorded in the Effort (days) column across the functional tabs. Vendors MAY additionally submit their own commercial materials in their preferred format (detailed cost breakdown, alternative pricing models, optional scope bundles, or supporting rate cards) as supplementary appendices; these supplement, and do not replace, the Pricing-row response.

6. Transition, migration & cutover

The application replaces the member-facing experience currently delivered through the incumbent stack. Note that this incumbent system is the source of migration data only; the GMS

Qodeca sp. z o.o.

the new app will integrate with going forward is being procured separately and is not yet selected (see §3.1). Vendors must address each of the following:

- **Member migration:** migrate member accounts deduplicated against the GMS Golden Record, minimising member friction; describe batch vs. event-driven approach, cutover window, and member-facing communications.
- **Data scope:** list at category level which historical data classes migrate and which are excluded.
- **Payment-credential migration:** baseline assumption is member re-tokenisation on first post-launch use; propose a compliant token-migration alternative if available.
- **Store listing:** recommend whether to publish a new App Store / Play Store listing or continue an existing one, with rationale.
- **Cutover model:** big-bang, phased by club, or parallel-run, with rationale and the definition of system-of-record per data category during any overlap.
- **Communications & hypercare:** bilingual, multi-channel member communications around launch; the post-launch hypercare period; rollback criteria and process if launch encounters severe issues.
- **Reference customers:** three reference customers of similar size and complexity (multi-brand or gender-segregated preferred), production deployments only, with permission for Armah to contact.
- **Regulatory & insurance commitments:** contractual commitment to ongoing PDPL compliance and store-guideline adherence; notification of any change in hosting region or sub-processors; professional indemnity insurance with certificate at signature and annually.
- **Exit & data portability:** member-data, configuration, and asset export with no hidden fees; statement of what Armah owns and what the vendor retains at contract end; removal of the app and member accounts from the stores; exit deliverables and transition support to a successor solution.

7. Assessment of custom-build proposals

As a custom build, there is no live product to demonstrate at this stage. Proposals are assessed on the completed Functional Matrix, the narrative response (Solution Approach & Commercial, Transition & Migration), the executive presentation, the proposed team and delivery plan, and the vendor's production track record on comparable builds. Armah may invite shortlisted vendors to a solution-walkthrough session to present their proposed architecture, delivery approach, and prior work.

8. Timeline

- 9 June 2026 — RFP package issued to vendors.
- 23 June 2026 — Deadline for vendor submissions.
- 30 June 2026 — Shortlist announced.

Qodeca sp. z o.o.

- 6–16 July 2026 — Board presentations. Shortlisted vendors present the executive concept.
- Late July / August 2026 — Negotiations and contract signing.
- February 2027 — Go-live.

Qodeca sp. z o.o.
